A HANDSOME and commodious building has been erected in the Minories to replace the Seething Lane Police Station, the accommodation in which has for a considerable time past been found inadequate. Situated at the corner of Goodman's Yard and the Minories it has a considerable frontage in both streets, and especially in Goodman's Yard. It is a red brick building, with the principal entrance at the corner of the two streets, the rounded corner being surmounted by a turret. On the ground-floor are the charge-room, the inspector's room and

the muster-room, and opening out of the latter is an apartment for the use of the detectives. Seven cells are provided, cased with white glazed brick, and lighted directly from the inner courtyard, instead of, as is usually the case, deriving their light from a passage. These cells are all heated and ventilated upon the most approved principles. In the basement are the mess-room and a large kitchen, together with the necessary offices and the coat and helmet-room. The ground floor contains, in addition to the official rooms mentioned above, a reading-room and a large recreation-room. The sleeping accommodation is excellent; every man will have his own cubicle, a little apartment 9 by 6 feet, each of which has its own window and a cupboard in which clothes can be kept. There are three floors of these cubicles, and on each landing there is abundant lavatory accommodation, with a bath-room. In all some sixty-five constables and sergeants can be accommodated at this station, in addition to a housekeeper. The building has been constructed from plans prepared by Mr. A. Murray, the City surveyor, and the work has been carried out under the personal superintendence of Mr. T. R. W. Mossman, of the City surveyor's office.

CEMENT PAVING TILES.

MR. F. S. BALESTRA, of the firm of Cosenza & Co., is now showing at 95 Wigmore Street a selection of artistic paving tiles, which are well worthy of the inspection of architects and others interested in such matters. These tiles, which are of admirable colour and design, are manufactured by a new patent process from hydraulically pressed Portland cement, and the advantages they offer are at once numerous and obvious. They join perfectly, and give a fine, perfectly smooth, but unpolished surface, and consequently an excellent foothold. They are quite impervious to moisture, and so hard that the surface will not pulverize with any amount of wear. Any design can easily be made to order, but the patterns in stock offer a wide selection, comprising as they do classical and geometrical designs of all colourings and sizes. They are easily kept clean, and as the pattern and colour, instead of being superficial, goes through the tile, the pavement cannot wear shabby. They will be found especially suitable for churches, schools, hospitals, halls, conservatories, courtyards, &c.; while for stables Mr. Balestra is showing grooved and corrugated tiles admirably adapted to the purpose, but devoid of the novelty which pertains to the ornamental section of the exhibition.

MESSRS. WM. WALLACE & CO.

AMONG all the sights at that very interesting exhibition which is now open—though it will soon be closed—at Earl's Court very few excite more curiosity and wonder than that part which is called "Old London," or by some persons "Antique England." Here may be seen several different kinds of shops,

Furniture Shoppe," and herein is to be found a very beautiful and most interesting display of furniture from the factories of the great firm whose title heads this article.

The furniture which Messrs. Wallace, of 151-155 Curtain Road, London, are exhibiting is of course very largely such as dwellers in "Old London" would have used, or rather did use, the object of the exhibitors having apparently been to show the

all with old-time signs and lettering, and some with prehistoric lanterns swinging over the signboard.

Of these reproductions of the establishments in which our ancestors carried on their business one is called "Ye Olde

public what old-time furniture was, just as the promoters of the exhibition have shown them old-time houses. If so, that object has been most successfully achieved, for a more representative and interesting display it would not be easy to find.

SPECIAL ATTENTION GIVEN TO ARCHITECTS' DESIGNS

Vol. LVII. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office: 175 Strand, London, W.C.

Yet not all of the exhibits were strictly of the old fashion, for there were one or two modern items therein contained, presumably to show the styles in contrast and juxtaposition, or perhaps the artistic result which would be secured by a tasteful blending of the two. But of the exhibits of Messrs. Wallace we had better speak in some detail, although it would be quite impossible even to enumerate them—to say nothing of describing them or dilating on their special features—in the limited space at our command.

The furniture is set out in a suite of rooms, and in the first of these is a cabinet quite in the antique style. It is in stained mahogany, and has a carved panel, while the shelves at the sides, as well as the top, carry some elegant vases of Della Robbia ware. Then there is a writing table in the same wood, and with carved back and plush-covered top. This is not strictly antique, but it is a very pretty table, and made a good contrast to its more old-fashioned surroundings.

A card table on the old lines stood open, with its cloth-covered top and sunk bowls for the money of the players. This top of course folds and revolves. In the same rooms were two very comfortable-looking easy-chairs which were entirely covered in tapestry, and some smaller chairs with tapestry seats. In this room, too, is to be seen a very beautiful antique cabinet in stained mahogany. The centre of this throughout and the lower part generally is enclosed, and the doors are glazed with small panes, which, being convex, have a very curious and striking effect. Near to this is a very pretty smaller cabinet.

A very remarkable music and book stand is on a square table or lower part, and the upper part, which is also square, can be either kept in that position or revolved in any direction. This is a very handsome and withal very useful article of furniture. Close to this is a fine cabinet with circular corners, all enclosed and lined with rich plush. It stands on a plinth, and thus has a solid and substantial bearing—a great desideratum where frail and valuable china is set out. Hereabouts also is a more old-fashioned show cabinet, intended—as is implied in its title—to contain and show china or other ornaments. Close to this there is a pretty little stand for holding flower-pots or other decorative articles, while ensconced in one corner is a corner cabinet which is quite in the old style. In this room there are also a settee with carved back and arms, and an arm-chair and single chairs, all *en suite*, in striped tapestry.

Then comes the dining-room, which is in oak. There is an

imposing sideboard with looking-glass back and the lower part enclosed. This sideboard is a very fine piece of work indeed, solid, substantial and handsome. The chairs and arm-chairs are *en suite* and covered in scarlet morocco.

Next to this dining-room is a dressing-room, the furniture of which is ash stained dark green, a curious and yet not unpleasing arrangement. There is a quaintly designed dressing table with dressing glass on top, this being not in the centre, but at one end, thus leaving space for a cabinet to contain toilet requisites. This room also contains a very elegant wardrobe and cabinet combined, which with a large plate-glass door had a very fine appearance.

Of the bedroom furniture it is not possible to speak at any length, for it is all most interesting and beautiful. A splendid winged wardrobe, each wing with bevelled looking-glass panel and the centre with finely-carved panel has a very good effect. Then there are a dressing table and washstand *en suite*, the latter having a tiled back and marble top, and a pedestal dressing table in which brass handles to the drawers make a good contrast to the dark wood. In this room, too, is a fine brass bedstead with handsome hangings in printed velvet.

In a smaller bedroom is a single wardrobe, one side of which has a bevelled glass door and the other a shorter wardrobe over two drawers. This is a very strikingly designed and very handsome article of furniture. There are also a fine washstand and dressing table to match, each being on the well-known cabriole legs in the old French style.

Of the chairs generally it should be said that, while most of them were in morocco or tapestry, some had the old English rush seats with a depression in the centre. These chairs are very comfortable, while the seats can be washed as often as required without fear of injury.

Here, however, our observations on the exhibits of Messrs. Wallace & Co., Curtain Road, London, at the Earl's Court exhibition must perforce be concluded. It only remains to be said that the display is one of the fullest and finest which it would be possible to arrange. For novelty, beauty, workmanship and high finish it could hardly be matched—most certainly not surpassed.

THE new workhouse infirmary, Newton Abbot, is being warmed and ventilated throughout by means of Shorland's patent Manchester stoves, with descending smoke-flues, by Messrs. E. H. Shorland & Brother, of Manchester.

A RUSSIAN CANAL.

A DEEP and long canal is to be built by Russia, to connect the Baltic with the Black Sea. This canal, as projected, is to connect Riga, on the Baltic, with Cherson, on the Dnieper, near the Black Sea. It is to be 1,000 miles long, 213 feet wide at the surface and 115 feet at the base, with a depth of 28 feet. According to a recent report of the United States Consul at Chemnitz, it is to carry the largest battleships of the world. From Riga the canal is to run into the River Dvina, thence by canals from Dvinaburg to Lapel, through the Beresina and Dnieper to Cherson. It is further projected to cover all the river regions with such a network of canals as will aid very materially in developing the whole surrounding country. Ships that went hitherto by way of the Atlantic, Mediterranean, and Sea of Marmora, taking more than twelve days, will now need less than six. Basins and harbours are to be built at all important points along the canal. Traffic is to be carried on day and night at a possible and permitted speed of about seven miles an hour. The cost of the canal is put down at about 20,000,000*l.* sterling, but it is anticipated that it will cost a great deal more than this. It is to be ready for traffic in five years.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on Monday evening, October 4, 1897, Mr. G. Maxwell Lawford, president, in the chair, a paper was read by Mr. James Croll, entitled "Filter Presses for Sewage Sludge."

The author first referred to the filter press as being the most commonly adopted method for reducing the moisture contained in sewage precipitation works. The press is constructed of a number of iron plates with drainage surfaces, and with slight modifications it can be applied to a variety of purposes. When first used for the treatment of sewage sludge it was found that the feed passages occasionally became blocked, causing the destruction of the plates by the excessive pressure on one side only. To remedy this defect special plates are now made.

There are two methods of introducing the sludge into the machine:—(1) The direct forcing system, consisting of pumping the sludge direct into the press by means of hydraulic forcing engines, (2) the pneumatic or air-pressure system, consisting of running the sludge into a vessel provided with a dip pipe,

and applying compressed air to the top of the sludge, thus forcing it up into the press. The air pressure generally used is about 100 lbs. per square inch. The addition of a small quantity of lime to the sludge facilitates the solidifying process, but hard cake can be produced without the aid of lime if sufficient time be given for pressing.

The author described the filter pressing machinery at the works of the Richmond Main Sewerage Board. This consists of six filter presses and appliances for the direct-forcing and the air-pressure systems. The advantages and disadvantages of the different processes were discussed, together with trials of the various filtering materials, lime, &c. Tables were given showing comparative work with the direct and pneumatic systems, also details of quantity of sludge cake produced in the district of the Richmond Main Board, with the cost per ton of producing pressed cake including all expenses. This comes out at 1*od.* for labour, 9*d.* for lime, 4*d.* for cloths, 3*d.* for coal, oil, &c., giving a total of 2*s.* 2*d.* per ton.

THE MANCHESTER SEWAGE CULVERT.

THE rivers committee of the Manchester Corporation are taking action in anticipation of their proposals with regard to the sewage culvert being approved by the ratepayers. The city surveyor has been instructed to prepare detailed plans and surveys of the scheme. The town clerk has been instructed to retain the following engineers to give evidence before a parliamentary committee in favour of the Bill if the necessary sanctions under the Borough Funds Act are given, viz. Sir Benjamin Baker, Mr. James Mansergh, Mr. Santo Crimp and Mr. Baldwin Lathom, and a sub-committee consisting of Aldermen Thompson and M'Dougall, Councillors Saxon, Bradley, Dreyfus and Grimshaw have been appointed to retain chemical evidence. With regard to the suggestion that Salford and Eccles should join with Manchester in the proposed culvert, arrangements have been made to receive deputations from any district authorities who care to send them. There are, however, difficulties in the way which are likely to prevent any combination of this kind. Owing to the different methods of chemical precipitation the aggregate effluent might not, it is said, be such as would be satisfactory. The only way out of this difficulty, if it be one, is to chemically treat the sewage from all these places at one centre.

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE

PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact it will **Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish. Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION

THE OLD DEER PARK, RICHMOND.

THE Old Park first cited in a survey of the manor, 21st Edward I., includes the grounds of the Sheen Palace, reinstated by Henry V. and rebuilt by Henry VII., whose successor bestowed it in dower on Anne of Cleves after her divorce. In a survey of 1640, its extent is given as 349 acres; these, with the manor, were settled on Queen Henrietta Maria in 1627. In 1707 Queen Anne demised the lodge for a term of ninety-nine years to James, Duke of Ormonde, who rebuilt the house, which on his attainder was bought, under an Act of 1721 in that behalf, by his brother the Earl of Arran, who sold it to the Prince of Wales (George II.). The lodge was then assigned to Queen Caroline, who had a dairy and menagerie in the park, and employed Rysbrack to make busts of English kings and queens for the Merlin's Cave, and Stephen Duck as her librarian. The gardens were first planted by Bridgman and then altered by "Capability" Brown. The lodge, whose site is marked in Rocque's plan of 1748 and his survey of 1762, was pulled down circa 1770; close by was erected, 1768-69, after Sir William Chambers's designs, the Observatory, latterly used by the British Association for the Advancement of Science. Chambers laid out the old Kew Palace gardens and designed various buildings, including the Pagoda, Mosque, Temple of Æolus, Temple of Victory (Minden), and the "Ruins," which he has described and illustrated. In 1785 an Act was passed enabling the king to close Love Lane and so unite Kew Gardens and the Old Deer Park into one. Sir Jeffry Wyatville built the Doric Temple, or "Pantheon," for William IV. The Queen presented the collection of mechanical models and philosophical instruments formed by George III. at the Observatory to King's College, London.

THE STUDLEY CASTLE ESTATE.

A FEW months ago Mr. J. R. Twentyman purchased the Studley Castle estate with the intention of living upon it, but business engagements have made it impossible for him to do so, and, as he is about to depart for China, he decided to resell the property rather than go to the expense of keeping it in order during his absence. It was offered in thirty different lots at Birmingham. The auctioneer said that prior to 1830 Sir Francis Goodrich spent an immense sum of money in making the estate one of the most valuable agricultural properties in

the county. He laid it out with a special view of making it a sporting estate. About 1833 Sir Francis commenced to build the castle, which, when completed, cost upwards of 125,000*l.* In 1864 his successor parted with the property to the late owner, Mr. T. E. Walker. The area then was 2,662 acres, and the purchase money 145,000*l.* exclusive of timber. Mr. Walker spent 30,000*l.* in improvements, making it of the value of 66*l.* an acre, exclusive of timber. Between 1864 and 1880 additional purchases were made, bringing up the estate to 3,750 acres. In 1893 100,000*l.* was offered for the lot, exclusive of timber. The total amount realised by the sale on the 7th inst. was 46,643*l.* The castle, standing in a finely-timbered park of nearly 270 acres, and containing in all an area of about 339 acres, and including valuable fixtures, was started at 5,000*l.* It was announced that a lady living in the Isle of Wight had offered to take it on a lease if it was not sold. The timber to be taken to was valued at 4,900*l.*, and, besides, there was a land tax of 11*l.* 3*s.* 3*d.* per annum. Mr. J. Green, Manor House, Studley, was the purchaser at 7,550*l.* Next the Home Farm, with a capital private residence attached and modern farm buildings, and having a total area of 328 acres, and with a rental of 901*l.*, was offered. The timber valuation was 961*l.*, and the land tax 7*l.* 6*s.* 8*d.* This was sold for 6,050*l.* The other lots were disposed of at reasonable prices, averaging twenty years' purchase of rental.

THE pile of buildings erected at Leicester for the purposes of technical and art schools were opened recently by the Bishop of London. The buildings, which cost 40,000*l.*, are erected on a site of 6,000 square yards in a central position in the Newarks, near the historic castle of Simon de Montfort. Two of the floors are devoted to technical instruction in hosiery, boot and shoe, engineering, dyeing and plumbing industries, while a building in the rear provides accommodation for instruction in dressmaking, &c. The hosiery and boot and shoe departments have been fully equipped with all the various kinds of machinery. The two upper floors, which comprise the school of art, have been furnished in the most complete manner. The local efforts have been supported by the authorities of South Kensington, while the art authorities of the French Republic have provided a number of large casts, screens, figures, &c., on the same terms as they are supplied to schools of art in France.

THE LIVERPOOL DOCKS.

THE announcement made a few days ago that the Mersey Docks and Harbour Board are contemplating the adoption of a project of the highest importance in connection with the development of the dock system of Liverpool has caused a flutter of expectation, says the *Liverpool Courier*, in local shipping and commercial circles. The magnitude of the undertaking may be guessed from the fact that it is proposed to spend no less a sum than four millions sterling in carrying it into effect. It is intended to disburse the whole of the money on the Liverpool side of the river. Some people—shipowners especially—may contend that the Cheshire side is better adapted to the demands of modern shipping, and doubtless a great deal may be advanced in favour of that view. But the plain fact remains that the Dock Board have not the smallest intention of moving in that direction. They believe that their money would be more judiciously spent in utilising and adapting the existing Liverpool docks to present-day necessities, rather than in launching into new schemes in the locality of Tranmere.

At least half a dozen different plans have for some time past been under the careful consideration of the works committee of the Board. Generally these have involved the deepening of certain old docks, the widening of dock entrances, the increase of quay space, and other adaptations all calculated to alleviate the necessities of trade at the Liverpool docks. It may incidentally be pointed out that the members of the Board view the increasing tendency to build larger vessels as wholly favourable to the port. The major portion of the money is to be expended upon the alteration and improvement of the southern and still more of the central docks. In many instances these are quite old-fashioned and totally out of date, but they are to be so changed as to bring them into line with the most modern docks in the possession of the Board. A number of improvements are to be effected at the North End, but these are by no means of so sweeping and far-reaching a character as are in contemplation at the other parts of the estate.

The scheme may be accepted as evidence of the new spirit of activity and enterprise which has been infused into the Board since Mr. J. W. Hughes accepted the chairmanship of its works committee. Already that committee has been instrumental in securing a number of improvements in the estate at a cost of upwards of 300,000*l.*, but its latest project entirely eclipses any previous exploit.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

22083. Thomas Madderson, for "An improved apparatus for use as a water-meter.

22080. Carlos Gonzalez y Perex, for "Apparatus for displaying luminous devices for advertising purposes."

22090. John Dibble and Samuel Henry Dibble, for "Improvements in or addition to a combined water-closet and sink."

22093. John Benjamin Meeson, for "An improved water-closet tank and connections."

22184. Charles Tomlinson and George Tomlinson, for "Check-spring cord rack for window-blinds."

22209. John Green, for "Improvements in or connected with machines for sowing seed."

22212. Hugh Basil Holme, for "An improved apparatus for raising and lowering blinds and the like."

22223. Edmund Fisher Hartshorn, for "Improvements in pulleys, chiefly designed for use with window-blind fixtures."

22252. Harvey Spencer, jun., for "Improvements in or relating to blinds."

22271. Karl Kunze, for "Improvements in the manufacture of artificial stones."

22315. David Black, for "Improvements in brick-making and other moulding machines."

22345. Henry Richard Barnard, for "Improved means for controlling the rise and fall of sliding sashes for windows of buildings, applicable also to carriage windows."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from $\frac{1}{4}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{1}{8}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact it will **Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish. Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION

PLYMOUTH.—Oct. 26.—For erection of a partition and sundry works at King Street school. Mr. E. Chandler Cook, 18 Princess Square, Plymouth.

PONTYPRIDD.—Oct. 28.—For erection of twenty or more houses near Aber station. Mr. W. Dowdeswell, architect, Treharris.

WESTON-SUPER-MARE.—Oct. 23.—For alterations, additions, &c., to Huntley's Restaurant, Regent Street. Mr. S. J. Wilde, architect, Boulevard Chambers, Weston-super-Mare.

WHITEHAVEN.—Oct. 25.—For building fire-engine station, workshops, boundary-walls, &c. Messrs. Moffat & Bentley, architects, Church Street, Whitehaven.

WHILE digging the foundations for some houses at Plymouth last week, the workmen came across a number of human bones. Several skulls, rib bones, leg bones and jaws were unearthed. One of the jaws contained a complete set of teeth, showing no signs of decay, but the other bones bore indications of great age. The spot where these remains were found is not far from Freedom Park, where, after several hours' fighting, in 1643, the Roundhead garrison of Plymouth finally routed the Cavalier army, which had surprised the outworks and nearly taken the town, after a protracted and unsuccessful siege.

VICTORIA STONE COMPANY.

ON Wednesday last the directors of the Victoria Stone Company entertained a number of the leading architects and scientific men at the Victorian Exhibition. An excellent lunch was served in the dining-room adjoining the Ducal Hall. After the usual loyal toasts, several of the architects present rose and gave testimony to the value of the Victoria stone as a building material. One of the speakers stated that he had used it on a building nearly thirty years ago, and that when he had last seen it (two or three years since) the arrises were as sharp as when the stone was fixed, although it had stood exposure to frost and snow for at least a quarter of a century.

Several speakers referred to the great progress that had been made during the last two or three years in the architectural stone-work supplied by the company, and congratulated them on the success of the architectural department under the able management of Mr. Charles Smith.

The company's exhibit, for which they have been awarded the Victoria era gold medal, was greatly admired.

At the Victoria Era Exhibition, Earl's Court (Ducal Hall), Messrs. W. Woollams & Co., 110 High Street, Marylebone, have an exhibit of wall-papers, dating from the first year of the Queen's reign to the present time, of special interest to architects, and have a man at work demonstrating the process of hand-printing. The jurors have just awarded them a gold medal.

THE Reading new art gallery, which has been erected in close proximity to the Municipal Buildings, was opened on the 19th inst.

ELECTRIC NOTES.

MONTROSE Town Council have resolved to apply to Parliament for a provisional order to introduce electric lighting for public purposes and house-lighting in the burgh.

THE electrical committee of Glasgow Corporation have accepted the resignation of Mr. Arnott, the electrical engineer. It was resolved to recommend the Council to advertise for an electrical engineer to take charge of and give advice on all electrical matters under the Corporation, including both electric lighting and motive power.

ANOTHER breakdown in the electric lighting of Dover took place on Sunday evening, which is a curious coincidence, as the previous difficulty also occurred on a Sunday. The failure appears to be due on this occasion to an accident in connection with the water-supply at the works, rendering it impossible to fill the boilers. The greatest inconvenience resulted, especially in some of the churches. After some time a hose-pipe was attached to a hydrant near the works, and the boilers being filled by this means the lights were got into working order.

A LIGHTHOUSE at Penmarch, in Brittany, was opened on the 17th inst. The electric lamp will be visible in fine weather at a distance of 62 miles and in foggy weather at a distance of 24 miles. It will far exceed in brilliancy any other lighthouse lamp. The lighthouse has been erected in compliance with the will of the Marquise de Blocqueville, daughter of Marshal Davoust, who bequeathed the sum of 12,000*l.* for the purpose.

VARIETIES.

THE Eccles Town Council have notified the Local Government Board of their intention to borrow 4,928*l.* for works of sewerage and storm-water drainage in the borough.

ST. AUGUSTINE'S Roman Catholic Church, Solihull, was reopened on Sunday last.

THE new public school of Errol was opened on Monday, the 18th inst., with considerable ceremony, by Sir William Ogilvy Dalgleish, Bart.

A MEMORIAL church which has just been erected within the grounds of the Crichton Royal Institution, Dumfries, was formally opened on the 15th inst.

THE first section of the new Catholic College at Blairs, near Aberdeen, has now been completed at a cost of 8,000*l.*, and was formally opened on the 13th inst.

SALE NOW PROCEEDING.

The ENTIRE FURNISHING STOCK of Mr. JOHN CROSSLEY, of NEWARK and LONDON.

£9,400 worth of Stock at 30 PER CENT. to 60 PER CENT. Reduction.

SPECIAL ILLUSTRATED SALE CATALOGUE
POST FREE.

HAMPSTEAD ROAD, W.

(Continuation North of Tottenham Court Road, and near Euston and Gower Street Stations.)

MASSIVE CARVED ANTIQUE OAK SIDEBOARD, the upper portion fitted with bevelled edge plates, with shelf supported on carved brackets, a richly carved panel below, the lower part fitted with three drawers on one side and a cupboard with shelf in the centre on the other, 4 ft. 6 in. wide, £5 18s. 6d.

ALL CARPETS MADE UP FREE OF CHARGE.

THE Duke of Cambridge visited Bath on Monday last for the purpose of opening the new pump room and laying the foundation-stone of the Victoria Art Gallery. Mr. Bryden is the architect of both these buildings.

AT Robinson's Opera House, in Cincinnati, three of the audience were killed and a dozen injured beyond hope of recovery by the fall of a portion of the ceiling and framework of the dome.

THE Earl of Crewe opened a new technical institute and also a sanatorium at Crewe, and the Town Council conferred upon his lordship the freedom of the borough. The buildings have been erected at a cost of nearly 20,000*l*.

THE Broadway Theatre at Deptford is nearly finished. The builders are now completing the tower, with its copper dome, and the interior of the building has been handed over to the decorators.

It has been decided that the clock tower which has been erected at Carter's Green, West Bromwich, as a permanent memorial of the public services of Alderman R. Farley shall be opened on the 27th inst. by the mayor, Councillor C. Akrill.

A NEW junior mixed school in connection with the Portman Place Board School, Globe Road, Mile End, was opened on the 18th inst. The new building will provide accommodation for over 400 children. The cost of the school worked out at about 24*l*. 6*s*. per head.

THE spinning mill of the New Hall Mill Company, Limited, in Elm Street, Burnley, was destroyed by fire on Wednesday morning. A fireman named Nuttall was killed by a fall of roof. The damage to the building and its contents is estimated at between 50,000*l*. and 60,000*l*.

DEVIZES CASTLE, the seat of Sir Charles Rich, which for centuries formed part of the dowry of the queens of England, and around which cluster so many memories rich in interest to historians and antiquaries, has just been disposed of by Messrs. Knight, Frank & Rutley, of the Conduit Street Auction Galleries.

WHILE a tall chimney was being taken down at Bevan's chain works, Dukinfield, the steeplejack, John Ward, called for his labourer, William Armitage, to get away, as the mass of brickwork was falling. He ran in the wrong direction and was buried beneath the debris, which came with a tremendous crash. He was killed instantly.

THE formal opening of new municipal public baths, erected at a cost of 5,000*l*., took place at Kingston-on-Thames, on the 18th inst. The new building comprises a swimming-bath of

the ordinary dimensions, supplied with tepid water during the winter months, and in addition has hot and cold slipper-baths and laundry conveniences.

A *propos* of our reference in last week's issue to Messrs. Spence's new premises, Messrs. Flint Bros. inform us that "the architects, Professor Banister Fletcher and Mr. Banister F. Fletcher, have entrusted the whole of the stonework to them, and that Ketton Stone, from Messrs. Molesworth & Co.'s quarries, and for which they are sole London agents, is being used entirely for this frontage."

A FATAL accident occurred on the 15th inst. at the Soho Ironworks, Bolton. A large crane was in process of being removed from the machine shop, when by some means it overbalanced and fell upon a labourer named Frederick Topping, twenty-seven years of age. The unfortunate man was completely crushed beneath the machine.

YORK HOUSE, the historical residence left to the Comte de Paris by the late Duc d'Aumale, came near destruction by fire a day or two since, owing to the overheating of a furnace flue. The damage caused by the fire was fortunately not great, but the new decorations in course of execution in readiness for the reception of the Comte and Comtesse were for the most part destroyed by the water.

AT the weekly meeting of the Salford Board of Guardians, Mr. S. Hill presiding, the clerk (Mr. E. Townson) said he found that 100,000*l*. for the proposed new workhouse could be obtained on loan at 3 per cent. Thirty years would be allowed for repayment, which would mean a charge of 2*d*. in the pound on the rates for fifteen years and 1*d*. for the remainder of the term. The Guardians have already decided to build a new workhouse, and Mr. Thompson now said he would like the question to be deferred until after the next election of guardians. The Chairman pointed out that notice must be given of a motion to rescind the resolution already adopted.

ST. ALBAN'S CHURCH, Birmingham, has been greatly improved by the erection of a handsome chancel screen, which has been erected by Messrs. White & Sons, of Oxford Street, London, from the designs of Mr. J. L. Pearson, R.A. This screen, which was dedicated on the 26th ult., consists of five arches resting upon a chastely designed and executed chancel wall. The central gate is surmounted by a large light iron cross. The ornamentation throughout is in wrought-iron ribbon scroll. An artistic feature of the new screen lies in the great variety of design displayed in the almost innumerable scroll terminals, no two of which appear to be alike.

SANITARY CONGRESS, LEEDS, SEPTEMBER, 1897.

THE HIGHEST HONOUR. SILVER MEDAL AWARDED.

THE "FRYSTON"

SIMPLEX OR DUPLEX FIRE. SUCCESS IN COOKING GUARANTEED.

Made in all types, either Leamington, as shown, or Yorkshire type, with high and low oven, from 4 ft. 3 in. wide by 4 ft. 6 in. high, to almost any size, or of the Restaurant and Hotel class, with any number of ovens.

Also made in small sizes with one oven, and with either side or back boiler, from 3 ft. 6 in. upwards, with one oven and either back boiler and hot hearth with rings and plug, or side boiler.

BUILDING AND BUILDERS.

THE memorial-stone of a new Constitutional Club has been laid at Hawick by the Countess of Dalkeith.

THE Princess Christian visited on Wednesday last the neighbourhood of Bryanstone Square for the purpose of laying the foundation-stone of a new hall and institute in connection with St. Mary's Church.

THE School Board of Paisley have accepted the design of Mr. John Hutchison, architect, Paisley and Glasgow, for a new two-storey school at Shortroods, in the Mossvale district, the estimated cost of which is 13,354*l*.

THE dedication-stone of St. Cuthbert's, Millwall, was laid on the 15th inst. by Lady Margaret Charteris, who has presented the land in Cahir Street on which the building is being erected. Adjoining the church, which will be erected in the district formed out of the parish of Christ Church, Poplar, will be a club-house and schoolrooms.

THE plans for the new Coronet Theatre, Notting Hill Gate, are completed and will be before the London County Council next week. The building, which will have a continuous frontage of 130 feet to the High Street, will be constructed entirely in white stone. The style is Louis XVI., and the building will be a handsome addition to the High Street. The theatre will be opened early in September 1898.

THE foundation-stone has been laid of a new church club and school rooms for the district of St. Cuthbert's, Millwall, situate at the corner of West Ferry Road and Cahir Street. The church, when completed, will consist of a chapel on the first floor capable of holding over 200 persons, and the ground floor will be fitted up with club and school rooms. The cost will be 3,000*l*.

THE plans of the proposed new station at Berwick have been forwarded from Edinburgh to Berwick for the inspection of the station authorities and for suggestions as to any alterations that may seem desirable. The plans provide for a new station. The cost is estimated at about 50,000*l*. There are to be three platforms fully 200 feet long and 30 feet wide. All the buildings now standing will be utilised and the present passenger station will become the east platform. The extension of the station will be on the west and north sides.

THE foundation-stone of a new church at Chapel Allerton, Leeds, has been laid. Though there is no authentic record of the fact, it is thought that on the site of the existing church

there stood, in the thirteenth century, a chapel which was attached to Kirkstall Abbey. Mr. G. F. Bodley has prepared the plans for the new building. They are on the lines of the Decorated Gothic period of the fourteenth century. Accommodation is to be provided for 800 people. The contractors are Messrs. Stephens, Bastow & Co., Bristol. The estimated cost is 16,000*l*.

A NEW Board school in Harehills Road, Roundhay, Leeds, which will be known as the Gipton School, was opened on the 14th inst. The building stands on a site measuring 7,000 square yards, and has a frontage to the main road of 290 feet. There are two departments—infants and mixed. Accommodation is provided for 1,600 scholars, exclusive of special accommodation for cookery and manual instruction and two large central halls. The infants' department is on the ground floor and consists of a large central hall and eight classrooms, two of which have been specially arranged for babies. The mixed department is on the upper floor, where the accommodation consists of a central hall and eighteen classrooms. The interior is bright and cheerful, all the rooms being well lighted. The exterior is quite imposing. The elevation is in the Elizabethan style, with two central gables in front. The cost of the building, including fittings, has been 17,000*l*., to which 2,100*l*., the cost of the site, has to be added. Mr. W. S. Braithwaite is the architect.

A NEW Theatre of Varieties is about to be erected at Bradford. The site is that of the Alexandra Hall, stabling and vacant land adjoining, in Horton Lane, containing an area of 4,400 yards. Mr. W. G. R. Sprague has the plans in hand. The building is to be of concrete and steel, and therefore fire-proof. The auditorium will accommodate 3,000 persons, and modern improvements, such as electric lighting and low-pressure hot-water heating, will be introduced. An imposing front will be given to the structure, and one feature of this will be a colonnade on the ground level. The entrance to the theatre will be through lobbies opening into a vestibule, or crush-room, 45 feet square, the roof of which will be carried by twelve marble columns with decorated caps. The vestibule, by two short flights of white marble steps, or slopes, will give access to the grand circle, boxes and fauteuils. The theatre will be decorated in the Arabesque style, and 2,000 16 candle-power electric lamps will illuminate the interior. Spacious saloons, retiring-rooms and lounges are to be provided for each section of the auditorium. The house will be built on what is known as the two-tier system, viz. fauteuils, stalls and pit on the ground

floor; grand circle and boxes on the first tier; balcony and gallery on the second tier. Every seat will have a clear and uninterrupted view of the stage. At the rear of the stage will be the dressing-rooms.

A NEW FLUSHING CISTERN.

MESSRS. CLAUGHTON BROS., Limited, of Bramley, Leeds, are on the point of introducing to the trade a patent syphon-flushing cistern, advance specimens of which were shown at the Health Exhibition, Leeds, and with which they were successful in gaining the bronze medal of the Sanitary Institute, the highest and only award for water-waste preventers at the Leeds Exhibition.

The cistern, named "Cloughton's Niagara," is fitted with a horizontal brass cylinder of drawn tube and brass syphon bend, in fact, all the fittings below the water-line are of brass.

A piston or plunger having a flap-valve works in the cylinder. This plunger, when operated by the lever, acts as a solid piston and charges the syphon. After the first pull the water continues to flow through the flap whether the chain is released or not, and as soon as the chain is released the weighted lever draws back the plunger into position ready for the next flush. The

plunger is worked by the ordinary lever and pull, but by a special contrivance the bracket or lever support is made reversible, and is also constructed to allow the lever with the plunger and fittings to be almost instantly withdrawn. It will thus be seen that either left or right hand cisterns can be made with the same fittings, and that the internal and most important parts are easily removable.

Among the advantages of this cistern may be mentioned: easy action; quick and powerful flush; it will flush with less than one gallon of water; all fittings are reversible and interchangeable; almost silent both in operating and discharging; it cannot be made to syphon continuously, thus being a perfect water-waste preventer. The advantages of having a drawn brass cylinder of perfectly smooth bore and all fittings of brass below the water line are obvious. The cistern will be made in wood, lead lined, all seams being burned by a special process; also in cast-iron, either painted or galvanized.

INSTITUTE OF IRON AND STEEL WORKS MANAGERS.

THE opening meeting of the session of this Association was held on the 16th inst. at the Institute, Dudley. Mr. J. W. Hall (newly-elected president) alluded to the recent loss the Institute had sustained by the death of Mr. Thomas Morris, of Warrington. He remarked that Mr. Morris, who was born at Bilston, and had been at Warrington since 1864, had always taken a great interest in that institute, and had contributed several valuable papers to the proceedings. He moved a vote of condolence with the relatives. Mr. M. Millard seconded, remarking that he had Mr. Morris's consent to nominate him as vice-president that night, and the motion was carried.

The Chairman proposed that Mr. La-Neve Foster be elected vice-president of the Institute, to fill the vacancy caused by the resignation of Mr. W. G. McMillan, who, he stated, had been appointed librarian to the Institute of Electrical Engineers. Mr. Turner seconded the proposition, which was adopted.

The President then delivered his inaugural address. He remarked that the Victorian era has been essentially the era of applied science. Its most remarkable feature had been the extraordinary advance made in the material well-being of the people, more especially in that of our labouring population, by the employment of machinery, which had rendered possible the

production and distribution of the necessities and most of the luxuries of life at prices so remarkably low, combined with the simultaneous payment to the workers of wages so much higher than the world had ever seen before, as would have appeared only two centuries ago wild and visionary in the extreme had anyone ventured to propose them. The advance made in the present century, and more particularly during the present reign, in the comfort of our people since the modern system of applying machinery had had full play, indicated that our hope of material prosperity in the future lay in still further development along the same path which had proved so conspicuously successful in the past, and taught us that if we were to hope to maintain our present scale of living it could only be by offering for sale to the inhabitants of the world articles produced by mechanical means at a price and of a quality which would induce them to purchase because they could not produce them so well and cheaply themselves, and to do this we must increase by every possible means the efficiency of our tools and of the men who employ them. Our competitors abroad fully realised this fact, and were doing all they could to increase their manufacturing powers. Had they any doubt as to the influence of machinery on the well-being of the people they had only to look around them. What were the trades in which wages were lowest? Why, precisely those in which machinery had not yet come to the relief of the worker, and where everything must be produced by manual toil. They heard much idle boasting that England's position amongst the manufacturing nations of the world was due to the fact that her inhabitants were essentially a constructive race, and the skill of her people as handicraftsmen unapproachable; but a very little sober examination of the history of our trade would show that our manufacturing supremacy was a matter of recent growth, due more to a combination of fortuitous circumstances than to any exceptional ability of our own as mechanics. Privileged or monopolised trade was no longer possible; there was now no aristocracy in production, no trading in an old name for any length of time, and those in the best position to know told them that the value of what was known as the "goodwill" of a business, once so valuable an asset, had now almost disappeared. The foreigner had ceased in many cases to produce mere copies of English tools; he was perfecting new types, often of very great merit, and was securing orders on their real intrinsic value. To supply the best article at the lowest possible price was the one qualification for success in the markets of the world to-day, as it always had been, and on this alone could we rely

for our trade. Circumstances had favoured England above every country for the last three generations, but it was the maddest infatuation to imagine that we were superior to all competition from abroad, and savoured of the self-sufficient complacency of the "celestial" Chinese, who, despising the "foreign devils" and all their works, still remained blind, in spite of the many rude lessons he had had of the efficacy of the methods and appliances of the "outer barbarian." Were we going to be similarly blind until we were rudely awakened by finding that the trade so lavishly thrown into our hands by fortunate circumstances had once more passed to its original owners because we failed to recognise the importance of adopting the best possible tools, and our workmen the absolute necessity of making the best possible use of them?

Mr. M. Millard, in proposing a vote of thanks to Mr. Hall for his address, remarked that it was an undoubted fact throughout the world that where iron and steel were used freely there was freedom, comfort, enlightenment and education, and that where they were not known there was darkness, morally and socially, and brutality.

Mr. Tucker seconded the motion, which was supported by Messrs. Edwards and H. Parry, and carried unanimously, Mr. Hall briefly responding.

THE COUNTY COUNCIL WORKS DEPARTMENT.

THE finance committee of the London County Council, to whom, since the abolition of the works committee, the duty has been delegated of controlling the finances of the Works Department, have just issued a report which contains a statement showing (1) the estimated and actual cost of works executed during the half-year ended March 31, 1897, and (2) the totals of the actual cost and of the final estimates, or the amount of the schedule value, of all the works executed by the Works Department since its creation. In all thirteen estimated works have been completed and reported during the half-year. The total of the original estimate for these works was 23,525 $\frac{1}{2}$ l., the final estimate being 24,099 $\frac{1}{2}$ l., and the actual cost 25,563 $\frac{1}{2}$ l., showing a balance of cost above estimate of 1,463 $\frac{1}{2}$ l. The loss on the half-year has been solely occasioned by the work on the extension of the Wandle branch sewer, for which the final estimate was 9,665 $\frac{1}{2}$ l., and the actual cost has been 12,011 $\frac{1}{2}$ l., or a balance of cost above estimate of 2,006 $\frac{1}{2}$ l. There is a slight excess in cost over estimate in two or three items, but an

PRICE LIST AND ESTIMATES ON APPLICATION.

analysis of the table shows that there has been considerable saving on some of the works. This has been the case particularly in the work done for the housing of the working-classes committee. The central laundry in the Boundary Street area, which was estimated to cost 6,532*l.*, has been constructed for 6,103*l.*, showing a saving of 429*l.*, whilst on the construction of a sewer on the same estate, estimated to cost 1,454*l.*, a saving of over 300*l.* has been effected. Small works executed for the fire brigade committee also show satisfactory results.

The table detailing the cost of jobbing works carried out during the half-year by the department for the different committees of the Council gives the schedule value of the works as 16,758*l.*, and the actual cost as 15,869*l.*, showing a balance of cost below schedule value of 889*l.* The value of the jobbing work done for the bridges committee was put at 2,443*l.*, and the actual cost was 2,115*l.*; for the fire brigade committee 2,877*l.*, and the actual cost 2,772*l.*; for the main drainage committee 6,670*l.*, and the actual cost 6,300*l.*; and for the highway committee 1,354*l.*, and the actual cost 1,284*l.*

An interesting statement follows, showing the totals of the actual cost and of the final estimates, or the amount of the schedule value, of all works executed by the Works Department since its creation. This shows that up to March 31 of this year the final estimate for all the estimated works carried out by the department was 459,772*l.*, and the actual cost 452,837*l.*, making a balance of cost above estimate of 3,125*l.* The schedule value of jobbing works executed from April 1895, when the system of a schedule of prices was first tried, to March 31, 1897, was 56,176*l.*, and the actual cost 52,260*l.*, showing a balance of cost below schedule value of 3,915*l.*

BUILDING IN ROME.

THE British Consul at Rome in his last report says:—No important public works have been executed in my district within the last two or three years, and I can only record some slow progress towards the completion of the following works or buildings formerly undertaken:—

National monument to Victor Emanuel on the north side of the Capitol. The large Policlinic Hospital outside the old city walls between Porta Pia and Porta S. Lorenzo. The banking of the river in continuation of the side walls from the Ponte Margherita upwards.

It has, however, been officially announced that in a short

time some important works will be undertaken in Rome, and I presume that in connection therewith articles of British manufacture will be employed, though in a small measure, considering that the works will mainly consist of masonry. I allude to the following:—(a) The completion of the side walls of the river embankment for the portion which remains to be built west of Ponte Elio (St. Angelo Bridge), and the demolition of the mad-house and of a portion of the St. Spirito Hospital; (b) continuation of the large collecting sewers right and left of the river; (c) the new quay on the river at the spot called Porto di Ripagrande. The estimate for the above works (a) (b) (c) amounts to 400,000*l.* (d) Completion of the Policlinic Hospital at a cost of 60,000*l.*; (e) continuation of the large building in the Prati di Castello for the Courts of Law (Palazzo di Giustizia) with an outlay of 360,000*l.* All the above works (a) to (e) will be paid for by the Government.

I should also mention a new hall to be built for the House of Deputies. The scheme of an entire new building for both Houses of Parliament having for the present been left in abeyance, it has been decided to build a new hall for the sittings of the House of Deputies on a site adjoining the Palazzo di Monteritorio where the House is at present located, doing away with the temporary construction which now occupies the quadrangle of that palace. The estimate for building the new hall and necessary adaptations of the main building amounts to 80,000*l.*

The financial resources of the municipality are not such as to allow them to undertake any large scheme in the way of public works, still that body has resolved to build a new bridge across the Tiber, which will be called Ponte Cavour, and is to replace the temporary iron construction, Ponte di Ripetta. In spite of the opening of the Ponte Umberto the above-named bridge continues to be the principal thoroughfare between the new quarter of Prati di Castello and the central part of the town. The new bridge will be built of masonry and stone at a cost of 52,000*l.*

A scheme has been for some time afloat, and it seemed to meet with great favour even in official quarters, of building a new harbour at Ostia to be connected with Rome by means of a railway. The Government having examined the scheme under the various nautical, commercial and financial aspects, the advantage of carrying it out appeared very doubtful, both as to its practical usefulness and probable financial results. The scheme will, therefore, undergo further consideration.

An interesting work to record is the new outlet for Lake

W. H. MULLIS, 48 Scrutton St., London, E.C.

Trasimeno near Perugia, which was much wanted, both in point of the healthiness of the locality infected by malaria owing to floods and stagnant water, and in point of cultivation of the borders of the lake. The outlet was completed in September, 1896.

AMERICAN v. GLASGOW TENDERS.

A MEETING of the Edinburgh and District Water Trust was held on the 14th inst. The works committee reported that at a meeting on October 1 seven tenders had been received and opened for providing 1,000 tons of dry sand cast-iron pipes from 4 to 10 inches in diameter, at present required by the Trust, that the committee remitted the tenders to the engineer to examine and check, and that as the pipes were urgently needed they instructed the clerk "to accept the tender of Messrs. MacLaren & Co., Glasgow, amounting to 5,287*l.* 11*s.*, if found to be correct, this being the most suitable offer."

Mr. Archibald, in proposing the approval of the report, said there were one or two matters in it which might be the better of some explanation. In the first place they would see that the committee instructed the acceptance of a Glasgow firm's tender as being the most suitable, though, as a matter of fact, it was not the lowest. They had tenders from different parties in Edinburgh and Glasgow, but the point to which he wanted to call special attention was that they had a tender from a Philadelphia firm amounting to 4,790*l.*, which was about 47*l.* below the one of which they recommended the acceptance. The reason the committee decided to accept MacLaren & Co.'s offer in preference to that of the Philadelphia firm were, first, that for this particular class of pipes the trustees were in a hurry and could not wait until the American firm could forward them; and in the second place, that they did not feel inclined at this stage to put their money into America without further consideration. The rate per ton of the Philadelphia firm was, on the average, 96*s.*, while the rate per ton of Messrs. MacLaren & Co. was as nearly as possible 10*s.* per ton higher. It was right, he thought, that it should be publicly known that they had tenders from America for pipes equally good and which it might be even more economical to lay than their own, because while their own pipes were 9 feet in length those offered by the American firm were 12 feet. (The Lord Provost:—"What about the carriage?") They were all to be delivered in Edin-

burgh. Had it not been for the fact that they were pressed, it was very probable the committee would have recommended the acceptance of the American tender.

Replying to Councillor Cranston, Mr. Archibald said the tenders were exceedingly close, one being 5,242*l.*, another 5,262*l.*, a third 5,349*l.*, a fourth 5,319*l.*, while MacLaren's was 5,287*l.*

PROTECTION FOR RIVER BANKS.

AN Italian engineer, Mr. Giovanni Villa, has devised a plan for the protection of river banks. It consists of a mantle of bricks set in a sloping position against the bank. The bricks may be of any size or shape, as convenience may suggest. These are bound together by a galvanised wire, an eighth of an inch thick. The wire runs through two or three holes in the brick, as required, and is fastened in the clay bank by means of anchor blocks, which are embedded several feet into soil. The bricks are threaded together and fastened so securely at intervals that they form a complete mantle protecting the bank. The bed of a river can be effectually covered by this method, and it is said that the works can be done as easily and cheaply under water as on dry land. The inventor has also constructed a machine which is capable of laying 165 yards of this mantle each day. One of the first applications of this invention in this country was at Hale Haven creek on the Thames last April, and experts who saw the work have praised it highly.

A party of Liverpool gentlemen recently journeyed to Heswall to inspect a piece of similar work which is in course of construction on the property of the Heswall Hall Estate Syndicate. Owners of land along the Wirral side of the estuary of the Dee have suffered great losses from time to time in consequence of the erosion of the banks. This syndicate, whose land runs down to the water's edge, resolved to check the further encroachment of the sea, and entered into a contract with the Villa Patent Mantle Syndicate for the laying of about 180 yards of the mantle. The foundation of the base of the mantle is laid in a concrete toe a few feet under the surface of the shore, and it rises to a height of 26 feet. The surface is perfectly smooth, and it is claimed that in the course of time as the little interstices between the tiles, which are rabbeted together, become overgrown with weeds and deposits from the sea, a band will be formed which will serve to render the mantle quite solid and durable.

LIGHTNING CONDUCTORS

EXAMINATIONS IN BUILDING CONSTRUCTION.

THE following syllabus of the subjects relating to building construction in which students of the classes of the Science and Art Department will be examined appears in the new edition of the "Directory":—

A larger number of questions will be set in the examination papers for the elementary and advanced stages than the candidate will be allowed to attempt, so that he will to a certain extent, be able to show his knowledge in such branches as he may, from circumstances, have paid special attention to.

First Stage or Elementary Course.

It is assumed that the student has already mastered the use of the following drawing instruments:—Rulers, ordinary and parallel; ruling pen; compasses, with pen and pencil bowsweeps, as well as the construction and use of simple scales, such as 1, 2, 3, or more feet to the inch, showing inches; or such as $\frac{1}{2}$, $\frac{1}{4}$, $\frac{3}{8}$, $\frac{5}{8}$, or other fraction of full size, or of any given scale or drawing; also the meaning of such terms as plan, elevation (front, back or side), section, sectional elevation.

He should understand the object of bond in brickwork, *i.e.* English bond, Flemish bond or English bond with Flemish facing, or how it is attained in walls up to three bricks thick in the following instances, *viz.* footings with offsets, angles of buildings, connection of external and internal walls, window and door openings with reveals and square jambs, external gauged arches (camber, segmental and semicircular), internal discharging arches over lintels and inverted arches.

He should know where to put wood bricks or plugging and their use, the construction and uses of brick corbelling, and the construction of trimmer arches in fireplaces.

He should be able to give sections and elevations to scale of the following kinds of mason's work, *viz.* uncoursed and coursed rubble, block in course and ashlar, with their bond and the proper dimensions of the stones as to height, width of bed and length, and of the following dressings, *viz.* window sills, window and door jambs, plain window and door heads, door steps, string-courses, quoins, copings, common cornices, blocking courses, and of the following methods of connecting stones, *viz.* by cramps, dowels, joggles and lead plugs.

He should be able to show how to join timbers by halving, lapping, notching, cogging, scarfing, fishing, and mortise and tenon; as applied to wall-plates, roof-timbers, floors, ceilings and partitions.

He should be able to draw from given dimensions, couple, collar and kingpost roofs, showing the details of the framing and of the ironwork.

He should be able to draw from given dimensions, single, double and framed floors, with or without ceilings beneath them; showing modes of supporting, stiffening and framing the timbers, trimming round hearths and wells of stairs; also floor coverings of boards or battens, rebated and filleted, ploughed and tongued, and laid folding, with straight or broken joints, bevelled or square heading joints.

He should be able to draw in elevation from given dimensions a framed partition with door openings.

He should be able to draw in elevation and give vertical and horizontal sections of solid door-frames and window-frames.

He should be able to describe by drawings beadings of different kinds, dove-tailing, cross-grooving, rebating, plough-grooving, chamfering, rounded nosing and housing.

He should be able to draw in elevation and give vertical and horizontal sections of the following doors, *viz.* ledged, ledged and braced, framed and braced, panelled, and the mode of putting them together, position of hinges and furniture, as well as to describe by drawing the following terms as applied to panelled doors, *viz.* square and flat, bead butt, bead flush, moulded, all on one or both sides.

He should be able to draw in elevation and to give vertical and horizontal sections of the following window-sashes and frames, *viz.* single or double hung sashes with square, bevelled or moulded bars, and cased frames; casement sashes hung to solid frames, with method of hanging and securing in each case.

He should be able to show in elevation and section the leadwork connected with chimneys, ridges, hips, valleys, gutters and lead-flats.

He should be able to give an elevation and section of the slating of a roof laid with duchess or countess slates on boards or battens.

He should be acquainted with the proper cross section for cast-iron beams for use in floor girders or bressummers, or as cantilevers, and be able to draw such a section in its right proportions from given dimensions of flanges.

He should be able to draw in elevation from given dimensions and skeleton diagrams, ordinary iron roofs up to 40 feet span, showing the sections of different parts and methods of connecting them.

Second Stage or Advanced Course.

In addition to the subjects enumerated for the elementary course—in all of which questions of a more complicated nature

may be set, combining work by the different trades—the knowledge of the students will be tested under the following heads, *viz.* :—

1. Freehand sketches explanatory of any details of construction, such as the joints of iron and wooden structures and other parts requiring illustration on an enlarged scale. These sketches may be roughly drawn, provided they are clear and capable of being readily understood.

2. The nature of the stresses to which the different parts of simple structures are subjected, as follows:—

In the case of beams, either fixed at one or both ends, or supported or continuous, the student should know which parts of the beam are in compression and which in tension.

He should be acquainted with the best forms for struts, ties and beams, such as floor joists exposed to transverse stress.

He should know the difference in the strength of a girder carrying a given load at its centre or uniformly distributed.

In the ordinary kinds of wooden or iron roof trusses and framed structures of a similar description he should be able to distinguish members in compression from those in tension.

He should be able in the case of a concentrated or uniform load or any part of a beam supported at both ends, to ascertain the proportion of the load transmitted to each point of support.

3. The nature, application and characteristic peculiarities of the following materials in ordinary use, for building purposes, *viz.* :—

Bricks of different kinds in common use, York, Portland, Caen and Bath stones (or stones of a similar description), granite, pure lime, hydraulic lime, Portland and Roman cement, mortars, concretes, grout, asphalt, timber of different kinds in common use, cast and wrought-iron, lead.

4. Constructive details as follows:—

The ordinary methods of timbering excavations, such as for foundations to walls or for laying-down sewers; the erection of bricklayer's and mason's scaffolding, the construction of travellers, the use of piles in foundations, hoop-iron bond in brickwork, diagonal and herring-bone courses in brickwork, damp-proof courses, bond timber in walls and the objections to it.

He should know how bricks are laid in hollow walls, window or door openings with splayed jambs, flues, chimneys, fireplaces and arches up to about 20 feet span; how mortar-joints are finished off, and the thickness usually allowed to them; why bricks and stones ought to be wetted before being laid.

He should be acquainted with the construction of brick ashlar walls, rubble ashlar walls, stone stairs, wooden stairs (both dog-legged and open newel), skylights, fireproof floors (such as brick arches supported on rolled or cast-iron girders, Fox and Barrett's, and Dennett's patent concrete floors), circular and egg-shaped drains, roofs of iron or wood for spans up to 60 feet; the fixing of architraves, linings and skirtings to walls, shutters to windows, lath, plaster and battening to walls, roof coverings of tiles and zinc, slate ridges and hips.

Written answers will be required to some of the questions.

Examination for Honours.

There will be two separate examinations—a written paper and a design—and no candidate can obtain honours who is not successful in both examinations.

The candidate will be called upon to answer in writing—illustrated by sketches, either freehand or to scale, as directed—questions on all the subjects previously enumerated for the elementary and advanced courses.

He must possess a more complete knowledge of building materials, their application, strength, and how to judge of their quality; and in the case of iron, of the processes of manufacture, and the points to be attended to in order to insure sound castings and good rivetting.

He must be able to solve simple problems in the theory of construction, and to determine the safe dimensions of iron or wooden beams subjected to dead loads.

In ordinary roof trusses and framed structures of a similar description, he must be able to trace the stresses brought into action by the loads, from the points of application to the points of support, as well as to determine the nature and amount of the stresses on the different members of the truss, and consequently the quantity of material required in each part.

In ordinary walls and retaining walls he must be able to ascertain the conditions necessary to stability, neglecting the strength of the mortar.

Those candidates who answer the questions in the written paper in a sufficiently satisfactory way will be permitted to enter for a practical examination which will be held at South Kensington. This examination will be held on one day. The time allowed for work will be seven hours—three hours in the morning and four hours in the afternoon. Candidates will be required to design some small building or portion of a building, including plan, section and elevation. The examination in Honours is not divided into two parts.

When candidates are directed to attend the examination they will be made acquainted with the nature of the building they will be called upon to design.

Candidates must themselves provide drawing instruments, T-squares and all other necessities, except drawing-paper and drawing-boards, which will be supplied by the Department.

EXTENSIONS OF LIVERPOOL DOCKS.

THE works committee of the Liverpool Docks and Harbour Board report:—

The committee having had under consideration for some time past the question of improving certain of the existing docks on the Liverpool side of the river with the view to provide increased accommodation for vessels of the largest class now frequenting the port, and bearing in mind the tendency to increase in the dimensions of vessels, and having had before them plans and reports from the engineer on the subject, it was resolved to recommend that the schemes for dock improvements, comprising the works set forth below, be generally approved, subject to such modification of details as may hereafter be thought proper, the total estimated cost of the works in question being 3,316,000*l*.

Works at the South End.

1. The construction of four branch docks, two on the west side of the Queen's Dock and two on the west side of the Wapping Dock, flanked with double-storey sheds and suitable roadways, including the deepening of the two last-named docks and the widening of the passage between them and alterations to the river wall from the Coburg Dock to the Anderton basin.

2. The construction of a graving dock, 630 feet in length, on the site of the present Queen's Half-tide Dock.

3. The widening and deepening of the north and south passages of, and the forming of a deep cut across the Coburg Dock.

4. The straightening of the north quay of the Coburg Dock and the construction of a shed thereon.

5. The construction of a new double entrance from the river to the Brunswick Dock at its south-west corner, the deepening of that dock, and the underpinning of the walls of the same and the lowering of the foreshore at the said entrance.

6. The construction of a new graving dock, 620 feet in length, on the site of the existing Brunswick Graving Docks.

7. The widening, lengthening and deepening of the Union Dock.

Works at the North End.

1. The construction of a branch dock on part of the site of the Sandon Graving Docks, and leading out of the east quay of the Huskisson Dock, flanked with double-storey sheds.

2. The construction of a graving dock, 1,000 feet in length, and having an entrance 50 feet in width, leading eastward from the north-east corner of the half-tide dock now in course of construction.

3. The formation of part of the existing Sandon Dock into a branch dock leading out of and of the same depth as the half-tide dock, and having a double-storey shed on its north quay.

4. The underpinning of the walls of the eastern part of the Huskisson Branch Dock No. 2, and those of the Huskisson Branch Dock No. 1, and the deepening of those docks.

It was also resolved to recommend that the parliamentary committee be authorised to take steps in the coming session of Parliament to obtain the necessary powers for the execution of the above-mentioned works, with such modification as may hereafter appear desirable, and provide for the carrying out of the works estimated by certain resolutions of the Board, and also for obtaining the necessary borrowing powers for the cost of the same, and the following, namely:—Modifications, conditions and exceptional contingencies in connection with the new works authorised under the Mersey Dock Act, 1891, estimate 817,000*l*.; construction of the new tobacco warehouse at the Stanley Dock, 300,000*l*.

The *Liverpool Courier*, in an article on the proposals, says:—The scheme may for popular purposes be divided into four main features. Take first of all the question of graving dock accommodation, which has been a prolific source of discontent to shipowners. What is the use, it has been asked quite recently, of building vessels of the largest type if coincidentally you do not afford them adequate graving dock accommodation? The Dock Board proposes to supply an answer to the question in an eminently practical way. At the south end two new graving docks, one 630 feet and the other 620 feet long, and both 80 feet wide, are to be constructed in lieu of the present obsolete and small graving docks—the Queen's and the Brunswick. At the north end a graving dock 1,000 feet long and 90 feet wide is to be built, in addition to the new dock 900 feet long which is now undergoing construction. These will displace the Sandon Graving Docks, which cannot take a vessel of more than 475 feet. Surely the dry dock problem will be regarded as satisfactorily solved when this aspect of the scheme comes into full operation. Just as complete and far-reaching is the attempt to grapple with the

difficulty of shed accommodation. At the north end the scheme will provide 3,560 lineal feet space of double-storey sheds 95 feet wide. This will be an entirely new addition to existing facilities. The south end will be supplied with 6,660 lineal feet of double-storey sheds each 95 feet wide. In the latter instance the fresh accommodation will only put out of commission a comparatively useless shed on the west side of the Queen's Dock, an old shed on the west side of the King's Dock, and a short length of shed between the King's and the Wapping Docks.

It is also impossible to note without a feeling of keen satisfaction that the passages are all 100 feet wide. Remembering the enormous advances we have made upon the ideas of our forefathers, it would, of course, be ridiculous to profess to read the future with absolute certainty, but as far as human probability, conjoined with eminent abilities and widespread experience, are able to indicate, these passages will meet the fullest requirements of the future. As the *Lucania* is only 65 feet wide, one would imagine that the Dock Board are not likely for generations to come to find 100 feet passages inadequate. The entrances are also to be sufficiently deepened. Some may be inclined to cavil that the deepening process has not been carried a trifle further. As a matter of practical expediency, the Board have to look not to Liverpool alone, but to other ports with which trade is carried on. As long as our entrances are as deep as those of the ports visited by the steamers trading with Liverpool, we are quite abreast of the requirements of the day. It would be an absurd waste of expenditure to deepen to an extent which is not likely to be needed. In these four essential matters of graving dock and shed accommodation and the width and depth of entrances, the Liverpool dock system ought to be the finest in the United Kingdom eight or ten years hence, and it is thoroughly reassuring to have such a bright prospect in view when we recall the activity and enterprise which are being shown by Bristol, Hull, and other rival ports in their endeavour to divert trade from Liverpool to their own centres.

A number of causes have combined to force this important project upon the attention of the works committee. One of these is the proved impossibility of dealing effectively with the influx of trade caused by a heavy cotton crop. At such a time of pressure the immense volume of cotton imports has been a never-ending source of trouble and anxiety. Nearly a million bales of cotton are landed every year in tramp steamers at the south end, and the docks and quays committee have been placed at their wits' end in their efforts to find room for the vessels. At the north end the Board have been confronted with the fact that all the regular liners are loudly crying out for more space. Almost a million of bales of cotton are landed each year by liners at the north end. Supplementary to these figures we find about 330,000 bales of cotton landed in liners at the south end, and about 450,000 bales conveyed by tramps to the north end. It is indeed during the prevalence of the cotton season that the Board always experience the greatest difficulty in coping with the situation. It is calculated by the most expert authorities that the additional accommodation provided by this new scheme will be more than sufficient to meet any emergency created by the heaviest cotton crop ever experienced in the history of the port.

Side by side with the enormous difficulty of handling the cotton crop, the one consideration which has led the works committee to adopt their present proposals is the ever-increasing size of merchant vessels. We are alluding now not merely to passenger steamers, but also to cargo boats. They are growing alike in length and capacity so rapidly that our present docks and sheds, with the exception of the very newest, cannot afford them accommodation. The advantage of the present scheme is that it opens the southern system to a length of 980 feet, whereas these docks are now restricted to about 530 feet, so far as the Harrington and Toxteth are concerned, while further north the extreme limit is about 440 feet. At the north end one great merit of the new plan is that out of the deep water entrance, 20 feet below old dock sill, it provides accommodation up to 980 feet. If we compare this state of things with the Thames, for example, we have no need to feel the slightest apprehension. Probably 500 feet is the utmost limit that a ship could safely navigate that river in its present state owing to the curves in the river.

The project is unquestionably a courageous attempt to deal upon permanent lines with a grave problem affecting the whole future of Liverpool as a first-class seaport. That it will receive the stamp of the Board's approval is already practically settled, and its progenitors will doubtless await with keen interest the verdict to be pronounced upon it by those outside the immediate circle of the Dock Board who are vitally associated with the commercial and shipping pre-eminence of Liverpool. The Chairman intimated that a convenient time will be set apart for the inspection of the plans by those interested in the matter. These latter would naturally prefer to enjoy the boons which the scheme will confer without suffering any of its corresponding financial burdens, but as they cannot have the one without the

other they may be disposed to submit gracefully to its penalties in acknowledgement of the benefits which they may fairly hope to derive from it.

The *Manchester Guardian* says:—The policy of making docks capable of holding the largest ships afloat is probably a wise policy for a port like Liverpool, but we cannot quite agree as to the non-speculative character of the scheme. The largest ship in the world is 694 feet long, a ship of 704 feet long is being built, and the longest cargo steamer afloat measures 600 feet. Building docks to hold "any number of ships 800 feet long," and some 980 feet long, when there are only three or four ships in existence which exceed 600 feet, seems to us to be speculation in the developments of shipbuilding. Such speculation is not necessarily foolish; in fact, Liverpool would not have suffered so much from competition if there had been a little more looking ahead ten or twenty years ago. But, for reasons which are perhaps not far to seek, the stately conservatism of the Dock Board has given place to an almost feverish anxiety to be in the van of progress, even, it seems, to anticipate the requirements of commerce.

THE BRITISH STEEL INDUSTRY.

ONE of the few gleams of sunshine that have appeared of late in the industrial horizon is afforded by the publication of the returns of the output of steel in this country during the first six months of the current year. These returns, as collected from manufacturers by the British Iron Trade Association, show, says a correspondent of the *Times*, that the total output of both Bessemer and open-hearth steel for the six months has amounted to 2,350,927 tons, which is at the rate of 4,701,854 tons per annum. This is by far the largest quantity of steel that has ever been produced in our own or any other European country during a similar period, although in the United States more than 6,000,000 tons of steel have been produced in twelve months. As compared with the first six months of 1896, the total increase of output of both descriptions of steel has been 381,616 tons, which is at the rate of 763,232 tons per annum. Of the total increase stated, 289,979 tons appertain to open hearth and 91,637 tons to Bessemer steel. Indeed, by far the most interesting feature of the statistics is the fact that they demonstrate the growing importance of open hearth and the diminishing relative value of Bessemer steel.

The Bessemer process, as is generally known, had a ten years' start of the open-hearth system, for which we are indebted to the late Sir William Siemens. During that period the Bessemer process had become firmly established as the process *par excellence* for the production of cheap steel, so that when the rival system entered the field it had to fight hard for its position. In 1877 the make of Bessemer steel had reached 750,000 tons, while the make of open-hearth steel was not more than one-fifth of that quantity. In 1894 both processes were running, for the first time, a neck-to-neck race, and to-day the open-hearth system has completely asserted its supremacy, the quantity produced in the first half of the current year being nearly 40 per cent. in excess of the output of Bessemer material. The natural cause and consequence of this condition of affairs may be traced in the extraordinarily rapid development of the open-hearth steel industry in the principal industrial centres of the country. This branch, originally established in South Wales, and afterwards begun in Scotland, is now carried on in Sheffield, Leeds, the Midlands, North Wales, Cheshire, Lancashire, Durham, Cleveland and other localities. The chief centres of production are Scotland and Cleveland, which have been running a close race for several years past, with the lead at present in favour of Cleveland. But the trade has witnessed remarkable expansion in other districts as well.

It would naturally be expected that the large and rapid growth of the steel trade would be a function of the corresponding decline of the old finished or wrought-iron manufacture, with which South Wales, South Staffordshire, Shropshire, Sussex and West Yorkshire have been identified for generations, and of which we find large and ample evidence in the gateways, railings and other old iron structures met with at every step of our wanderings in London and elsewhere. The old finished iron trade, however, still survives, and in some districts, notably in Scotland, is as vigorous and important as ever. It is otherwise in Cleveland, South Wales, and to a large extent in the Midlands, where steel has rapidly been displacing iron within recent years, and still continues to do so. But steel has found fields of its own entirely outside of those held by the rival material whose position it has so largely usurped. Perhaps the best evidence of this is furnished by the fact that our total make of finished material for the current year will be in the neighbourhood of six million tons, whereas some twenty years ago it did not exceed one-half of that quantity. This great development has been brought about chiefly by the extension of industrial requirements

TO ARCHITECTS, BUILDERS, &c.

The Cheapest, Best, and most Durable Material for Floors, Walls, and Roofs
is the unrivalled

PHRAHZIT.

PHRAHZIT is Sanitary, Hygienic, Light, Fireproof, Waterproof, Cheap, cannot Rot, is a non-Conductor of Heat, non-Conductor of Sound, non-Conductor of Electricity, will not Crack, is very Durable, and in ordinary wear indestructible.

63 & 64 CHANCERY LANE, LONDON, W.C.

JOSEPH T. SZEK.

AGENTS APPOINTED IN ALL LARGE TOWNS.

generally, but also, in no small degree, by the great excellence of quality and the cheapening of cost. Within that period prices have fluctuated so largely that in one case within the knowledge of the writer steel rails were being supplied by the same firm at the same time to one customer for 11*l.* and to another for 4*l.* 15*s.* per ton, the first price representing an earlier contract of three years' standing. The cost of steel has been reduced by fully one-half within a comparatively few years. Both Bessemer and open-hearth steel ingots can now be purchased for between 3*l.* and 4*l.* per ton, and practically at the same prices. One of the main sources of the improvement in the steel trade has been the greatly increased demands for shipbuilding material. The tonnage of shipbuilding constructed in the United Kingdom is now nearly 1,500,000 tons, or about twice as much as it was twenty years ago. Not only so, but within the same period we have largely supplied the shipbuilding material of other countries, including Germany, by a large export business. It is true that continental countries have recently made special efforts to secure to themselves the supply of all their home materials of construction, and some of them have been increasingly successful in this direction, but Great Britain still remains as much as ever the leading country for shipbuilding iron and steel, as well as for the industries in which these materials are so largely employed.

It is only a few years since the price of ship-plates, made by the open-hearth process, was 10*l.* to 12*l.* per ton. For the last two years the price has fluctuated between 5*l.* and 6*l.*, and yet some firms have made at least as large profits at the lower price as were possible at the higher. This result has been accomplished mainly by economies in production, of which the output of a larger yield from a given plant by better methods of handling the material has not been the least notable. Larger furnaces have also been responsible for a good deal. Twenty years ago we had few furnaces of more than ten tons capacity. To-day we have many furnaces of 40 to 50 tons. An output of 12,000 tons per furnace per annum is not now uncommon where an output of 5,000 tons would have been deemed remarkable in 1877. In other respects, and not least so in providing heavier and more powerful machinery for rolling steel plates of the largest size, as well as many other shapes, the conditions have been greatly altered. Nor need we hesitate to feel satisfied with the fact that, whatever may be our position in other branches of manufacture, we are far ahead of any other country both in the practice and in the production of our open-hearth plants. It is to this fact, perhaps, as much as to the

long and well-deserved reputation of our shipbuilders, that we owe the present unique position of our shipbuilding industry.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

22657. Henry Justus Eck and Harold King-Smith, for "An improved switch for large numbers of electric circuits."

22662. Benjamin Harlow, for "Sewage filtering screen or tank for clarifying sewage and reducing the refuse."

22664. John Peers, for "An improved ventilator."

22683. Rudolph Hauptmann, for "Improvements in processes for the manufacture of and undercutting tiles, bricks and other articles."

22684. Thomas Dalton, for "Improvements in presses for the manufacture of and undercutting of tiles, bricks and other articles."

22692. Jane Susan Jephson, for "Improvements in means for ventilating churches and the like buildings or halls."

22706. William James Vincent, for "Improvements in ladders."

22798. Gerhard Vehrenhamp and Heinrich Saltzwedel, for "A new and improved construction of brick."

22805. August Carlewitz, for "Improvements in the manufacture of cornices and other articles of plaster and the like which have surface ornamentation in relief."

22828. Albert Henry Terrie, for "A perpetual motor."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Mesher from $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{3}{16}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental buildings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

THE EXPANDED METAL COMPANY, LTD.

39 UPPER THAMES STREET, LONDON, E.C.

Telegraphic Address, "Distend, London."

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

BYFLEET.—Nov. 13.—The committee of the proposed village hall for Byfleet invite competitive plans for a village hall and working-men's club, to be erected at a cost not exceeding 1,500l. A premium of 25 guineas will be awarded. Mr. F. C. Stoop, hon. sec., Albany House, Byfleet, Surrey.

CARDIFF.—Dec. 4.—The Corporation offer premiums of 500l., 300l. and 200l. respectively for the three best designs for a new town hall, law courts, &c. Mr. W. Harpur, Town Hall, Cardiff.

DORKING.—Dec. 15.—Competitive designs and plan, with descriptive report thereon and approximate estimates, are invited for erection of infirmary upon workhouse grounds. Mr. George Scales, 35 High Street, Dorking.

SOMERSET.—Nov. 30.—The Council invite competitive plans for large hall, with cloakrooms and retiring-rooms over present post office, market house and fire-engine house communicating with the town hall, and for conversion of market house, &c., on ground-floor. Premiums of 25l., 15l. and 10l. will be awarded. Mr. Regd. L. Foster, town clerk, 1 Cathedral Green, Wells.

SOUTHEND-ON-SEA.—Nov. 20.—Plans invited for new church. Rev. E. E. Kimber, St. Albans, Avenue Terrace, Southend-on-Sea.

COMPETITION DECIDED.

BLAENAU FESTINIOG, NORTH WALES.—In an open competition for the new County Police Buildings the design of Mr. T. Taliesin Rees, A.R.I.B.A., of Birkenhead, has been selected. The accommodation had to include charge-room, cells, magistrates'-room, court-room, solicitors'-room, witnesses'-room, superintendent's office, &c., together with residence for inspector. There were eighteen sets of plans sent in.

THE new centenary buildings erected in connection with the
Wesleyan church at Melton Mowbray are now open. A consider-
able amount of property in the neighbourhood of the chapel was
purchased a year ago, and upon a portion of the space which
this occupied has been erected a suite of rooms, including a
spacious lecture-hall and a number of classrooms. The total
expenses in connection with the extension scheme will be about
2,500*l*.

NEW CROSS, LONDON, S.E.

TRADE NOTES.

THE North Riding Infirmary, Middlesbrough, is being warmed and ventilated by means of Shorland's patent Manchester stoves, with ornamental tiled sides.

MESSRS. OETZMANN, of 62-79 Hampstead Road, N.W., ask us to mention that they are offering at reductions of from 30 to 60 per cent. every class of furniture and equipment, including carpets, curtains, silver, electro-plate, china and glass. They have bought the entire stock of Mr. John Crossley, of Newark and London, amounting to close upon 10,000l., and are also including the whole of their own attractive stock, as they are on the eve of making large additions to their premises and wish to avoid damage.

A HANDSOME oak reredos has just been erected in the parish church of Kirkheaton, near Huddersfield. It is given in commemoration of the completion of the sixtieth year of Queen Victoria's reign, and in remembrance of William Edwards Hirst, of Lascelles Hall, by members of his family. The work was entrusted to Messrs. Jones & Willis, of Birmingham, London and Liverpool.

A NEW material, to which the name "Phrahzit" has been given, is now being introduced to the notice of architects, and will more than repay the time devoted to becoming acquainted with its special qualities and varied uses. Its primary use is for covering floors, walls, ceilings, roofs, &c., and rendering them fireproof; and that it effects this is proved by the samples we have seen after being subjected to a temperature of 1,000 degrees, and which are uninjured and retain their original colours, although the cement with which they are backed is reduced to carbon. It has, however, other features equally interesting to our readers, being sound-proof, a result that has hitherto only been obtainable by the introduction of expensive materials. It is also waterproof, and can be washed without retaining any moisture, preventing rotting; is a non-conductor of heat, and is not affected by heat or frost, and being of a plastic substance it does not crack. "Phrahzit" is a material composed principally of wood-pulp chemically treated, which accounts for its extreme lightness, a desideratum in any material used for building purposes. It is used either dry or wet, in the former manner for floors, and after being laid is rendered a solid piece by means of moisture, and in the latter for walls, ceilings, &c., being applied in a similar manner to plaster. It thus forms a solid surface. It can also be supplied as tiles or mosaics, or

moulded and shaped into any design for ceiling or wall decoration, pilasters, balustrades and other forms of architectural decoration. It is produced in any colour and pattern in imitation of costly marble or parquetry. We have said sufficient to show that, as the patentee claims, it is sanitary, light, fireproof, &c. Further particulars can be obtained from Mr. Joseph T. Szek, of 63 and 64 Chancery Lane, W.C.

ELECTRIC NOTES.

ARRANGEMENTS are now being completed whereby the corridors and offices occupied by the officials of the Crown Office and the Associate's Department at the Royal Courts of Justice will in future be supplied with electric light from an outside electric-lighting company instead of from the inside source as at present.

THE use of the "X" rays has had a curious result in Paris. A painting, as to the authorship of which there was some doubt, was "radiographed," whereupon the great artist's name (Albert Dürer) was discovered beneath the accumulated dirt of many years, thus establishing the authenticity of the picture.

AT a special meeting of the Hamilton Town Council it was resolved to apply to the Board of Trade for a provisional order, under the Electric Lighting Act, 1882, to authorise them to supply electricity for public and private purposes within the municipal bounds of the burgh.

THERE has been inaugurated in the city of Malaga another development of English capital in Spain, by the opening of an electricity supply works there, erected to the plans of Mr. Robert Hammond, of London, for a group of London capitalists. The works and plant were duly blessed by the Provincial of the Jesuits, Very Rev. Father Sensano, in the presence of Mr. Robert C. Wyatt, the chairman of the company. The plant, by Fowlers of Leeds, ran through its first night's service with a smoothness that astonished those not accustomed to the solidity of English work. The electric light is an immense boon in so hot a climate, and there are already 600 customers wired.

THE *Melbourne Argus* of September 20 says:—According to the evidence of Mr. H. W. Jenvey, the electrical inspector of the Post and Telegraph Department, the recent fatality to a boy who climbed a pole at Malvern and laid hold of an electric-light wire was due to a defective insulator fastening. Mr.

147 STRAND, LONDON, W.C.

Jenvey has now been called upon for an official report on the matter. This will be forwarded to the Crown Law Department, with a view of considering whether proceedings should be taken against the New Australian Electric-Lighting Company under the Electric Light and Power Act.

AN accident of a very unusual nature occurred in Edinburgh a day or two since. The electric light is being introduced into a shop in Georgie Road, and in order to make the connection with the mains running beneath the pavement there, the workmen had to break the earthenware ways. In the course of the operations the men on more than one occasion used a lighted lamp. At first nothing occurred to lead to suspicion that there was danger in so doing, but they were surprised to find at a later stage that some gas in the ways had become ignited. Carried along the earthenware tubing the flame soon reached a "box" in the street where the gas had evidently gathered, and with a loud bang the cover of the "box" was blown into the air, and in falling severely injured a little girl.

AN inquiry was held by Major-General H. D. Crozier, R.E., in Bradford, on the 26th inst., into the application of the Local Government Board for sanction to borrow 50,000*l.* for the purpose of extending the machinery, plant, mains, and effecting improvements in connection with their electricity works. This will bring the Corporation's borrowing powers on their electricity works up to 120,000*l.*, and they asked for sixty years in which to repay the amount applied for. The inspector, however, pointed out that twenty-five years was the period now usually allowed. The town clerk (Mr. George McGuire) explained the accounts, and afterwards the inspector proceeded to view the works.

BUILDING AND BUILDERS.

A NEW town hall is to be built at Belfast at a cost of 155,000*l.*

AT a meeting of the Kingston-on-Thames Jubilee Hospital committee on Monday night, the 25th inst., a tender was accepted for the erection of the building at a cost of 3,580*l.* It was decided that the foundation-stone should be laid by the Mayor on November 6.

THE foundation-stone has been laid of the new St. Paul's Episcopal church in Springwell Avenue, Airdrie. The church, which is being built of red stone from Bothwell Park quarries, is from designs by Mr. H. D. Walton, Glasgow. It is being

seated for 200 worshippers and will cost 1,300*l.* The building is in the Early Decorated style of Gothic architecture.

THE foundation-stone of St. Matthew's Episcopal church, Possilpark, was laid on Saturday afternoon. The new church, which is situated in Ardoch Street, is from designs by Mr. H. D. Walton, architect, Glasgow, the style being the Late Decorated Gothic. The front block has a frontage to Ardoch Street of 60 feet, and consists of two large rooms, capable of being thrown into one, on the ground floor, with an upper hall, chancel and vestries above. Two large entrance porches and lobbies will give access to the church, which will fill the rest of the site eastwards. The front wall will be of red stone, the interior walls being faced with brick, and the hall will have an open timber roof. The church, which will consist of nave and aisles, organ chamber, vestries and chancel, will be seated for about 500. The total cost will be about 3,000*l.*

VARIETIES.

THE trustees of the Friendly Societies' Home have appointed Mr. A. Saxon Snell, F.R.I.B.A., architect for the erection of a home at Herne Bay for fifty patients.

THE Mayor of Gloucester laid the foundation-stone of the administrative block of the new infectious hospital on the Vineyard Estate at Over on the 21st inst.

WORKMEN are now busy demolishing the northern side of Parliament Street, and the widening of the already handsome thoroughfare will soon be an accomplished fact.

THE Bishop of Lincoln has opened a new building at Spalding, designated the Church Cote, which has been erected for the use of local church organisations. The cost was over 550*l.*

A NEW schoolroom, which has cost 5,000*l.*, was opened on Friday last at Ellesmere College, which flourishing branch of the Woodard schools was established in 1884.

ONE of the largest churches in Santa Rosa, a city in Sonoma county, Cal., of about 7,000 inhabitants, was, says an American paper, entirely built, including inside finish in wood instead of plaster, from a single redwood tree; and, in addition to building the church, over 60,000 shingles were taken from the same tree.

PREMISES, LIONEL STREET, BIRMINGHAM.

SURREY COUNTY HALL, SURBITON.

has been erected in the Parc Monceau, Paris. The spot is chosen in pathetic remembrance of a passage in one of the writer's novels, in which this verdant, leafy Parisian resort was described.

THE Conference convened by the Municipal Officers' Association will hold an adjourned meeting in London on Thursday, November 4, to consider what action it will take with regard to reintroducing a Superannuation Bill in the next session of Parliament. Mr. C. J. F. Carnell, 33 Paulet Road, Camberwell, is hon. secretary to the Conference.

A FIRE of disastrous proportions occurred at Glasgow on Tuesday morning. In an alley between York Street and James Watt Street, in the midst of a locality given over almost wholly to bonded stores of spirits, tea, tobacco and other Customed goods, a large block of warehouses was totally destroyed, while several others were partially burned, and damage caused to the amount of about 50,000*l*.

THE Grammar School at Normanton, which dates back to the reign of Elizabeth, having been rebuilt, was formally opened by the Earl of Crewe. The building is situated in Church Lane. Built of brick with stone dressings, it has an attractive exterior. It provides accommodation for eighty students. Around it is an extensive playground.

THE Brewers' Exhibition opens at the Royal Agricultural Hall, Islington, to-morrow, October 30. This exhibition has, during its nineteen years' existence, done much to benefit the important trades whose interests it represents, besides being a source of attraction and information to the general public. The malting barley competition, which has been the means of spurring on the farmer to obtain better seed and devote more care to barley cultivation, will again form one of the leading features of the exhibition, and in spite of the difficulties of the

season that growers have had to contend with, the entries bid fair to reach the total of last year.

THE new and handsome club premises, erected in Norfolk Street by the Liberals of the Leeds South Ward, South Leeds, at a cost of between 3,000*l*. and 4,000*l*., were opened on the 23rd inst. The building is two storeys high and is constructed of red brick with stone dressings. On the ground-floor is the club, where are a large billiard-room, containing three tables, a recreation-room, a reading-room, a central hall, in which the bar is located, and several other smaller apartments. On the second floor is a large assembly-room, lighted principally by a Tudor window, which takes up the greater part of one end of the hall.

THE church of St. Laurence, Tidmarsh, which has recently undergone a thorough restoration from Mr. Oldrid Scott's plans, ably carried out by Messrs. Boxall & Son, of Pangbourne, was reopened on the 19th inst. Two frescoes of saints were discovered in a window on the north side, which have added greatly to the interest of this ancient little church, which possesses a very rich Norman doorway, a beautiful old font and a polygonal apse. The remarkably pretty steeple of oak shingles bears the gridiron as a vane. The cost of the restoration is estimated at 900*l*.

A NEW day and Sunday school for the parish of St. Stephen's Rashcliffe, Huddersfield, was opened on Saturday, the 23rd inst. The building, for which Mr. J. Berry, Huddersfield, was the architect, is light and airy, and comprises central hall, two classrooms and infants'-room, the whole providing accommodation for 185 children, whilst by movable partitions at the extreme ends of the central hall the classroom accommodation may be increased. The tenders for the work amounted to 1,510*l*.

THE church of St. Paul, Northwich, owing to the ravages of salt subsidence and the fears entertained of further sinking, has been closed to the public. In August a portion of the sanctuary floor collapsed. Since then service has been regularly held in the church, but an architect has condemned the building, fresh cracks having developed in many parts of the structure. It has been found that the chancel is built upon arches which are regarded as insecure, and it has therefore been deemed advisable to suspend all gatherings in the church. The roof, the main walls and the porch have suffered severely, and entire reconstruction is imperative.

VERITAS LAMP WORKS,
83, 85, 87 FARRINGTON ROAD, LONDON, E.C.

A HANDSOME and artistic reredos has been added to the decorations of St. Matthew's Church, Sinclair Road, Kensington. The new adornment is from designs by Mr. Litchfield, of the Sinclair Galleries, and is constructed of stone in the Gothic manner, leaving a space to be filled by an old painting by Nicholas Droost, which the designer has been fortunate enough to secure for the purpose. On either side to the north and south are oak panels in the same Gothic style, while the chancel walls, which were previously of plain brick, have been carefully coated with a green in harmony with the rest.

THE new hall at the Maltland, Inverary, in which castle gatherings will be held, has now been completed, and Her Majesty's Diamond Jubilee rejoicings, which had been deferred at Inverary Castle for lack of adequate accommodation, will be held there. The building is 120 feet long by 40 feet wide and 45 feet high, with a raised dais at the west end, and a gallery at the opposite end, which will be used as a tea-room. There are three doors in front and one in rear, with five large windows on one side and seven on the other. The illuminating power at night is derived from eight large incandescent Swan lamps of 150 candle-power each. The cloak-rooms and lavatories are beneath the gallery, and are fitted up with small incandescent lamps. The work was under the direct supervision of Mr. Wyllie, chamberlain of Argyll. Kitchen and supper-rooms have been erected in rear of the main building.

ON Sunday morning fire was discovered to have broken out on the farmhouse of Fassifern, about 12 miles from Fort William. The outbreak, which occurred in the kitchen, is believed to have been caused by a chimney catching fire and igniting some old joists which protruded into the flue. In a very short time the whole of the kitchen was a-blaze, and all efforts to extinguish the flames proved futile. The workmen at present engaged at the construction of the Mallaig railway rendered valuable assistance, and when it was seen that the kitchen could not be saved a number of men got on to the top of the house and with hatchets and crowbars managed to sever the burning part from the house proper. The day, fortunately, was quite calm, or in all likelihood the whole steading and offices would have been consumed. As it was, the kitchen was completely gutted and its contents destroyed. The damage, which will amount to several hundred pounds, is covered by insurance. Although now a farmhouse, Fassifern was at one time the home of a branch of the Camerons of Lochiel, and Prince Charlie is said to have slept there during the rebellion of '45.

THE colossal monument to the Tsar Alexander II., which is being erected in the Kremlin, is rapidly approaching completion. The statue, nearly 16 feet high, is the work of the Russian Academician Opekouchine, from the design of M. Joukovesky. It stands on a huge block of Finland granite, weighing about 23 tons, and is surmounted by a cupola or canopy of the same material, save that the pyramidal roof, reaching 100 feet into the air, consists of gilt-bronze plates, the pattern showing out upon a background of black enamel. Round the canopy run arched galleries decorated with mosaics representing the thirty-three Sovereigns of Russia. Gilt bronze is freely used in the external ornamentation, and seen from a distance the whole structure suggests the idea of a fabric of gold. When finished the total cost will exceed a million and a half of roubles.

TENDERS for the erection of the new buildings for the Glasgow School of Art have been accepted. The plans, which are by Messrs. Honeyman & Keppie, are of a very complete description, and embrace all recent ideas and improvements. The site has a frontage to Renfrew Street, between Dalhousie Street on the east and Scott Street on the west, with a length of 250 feet to Renfrew Street, and a depth of 77 feet, and the building will face north and be of three floors. The foundations of the whole structure will be laid at the beginning, but only a portion of the building will be undertaken in the meantime, namely, the part which commences at the eastern boundary in Dalhousie Street, and runs west to the western wall of the main entrance in Renfrew Street. This section includes the western walls of the museum and main staircase. The cost of this portion is estimated at a little over 18,000*l.*, and the area covered will be about 1,200 square yards.

THE Darnley Fever Hospital, which is now completed and ready for the reception of patients, is situated on the main road between Nitshill and Thornliebank at a point at which that road is joined by roads from Pollokshaws and Barrhead, and it is distant about half a mile from Nitshill railway station. The hospital is situated as nearly as possible in the centre of the district from which its patients will be derived. Accommodation is provided for forty-two adult patients. A large proportion of the patients, however, will be children, so that the hospital may be set down as equal to the accommodation of about sixty patients. The cost of the hospital has been something under 15,000*l.*, which on the nominal accommodation of forty-two beds works out at 357*l.* per bed.

A CONCRETE ARCH.*

DEER PARK is the name applied at the present time to an enclosure of some 400 acres on the east bank of the Big Vermillion River, about 4 miles from its junction with the Illinois River. The place is one of historic interest, and derives its name from the main canyon within its enclosures, the name having been applied to this gorge by the early settlers, and possibly the Indians, who, history tells us, used it for entrapping deer.

Deer Park is now the property of Mr. F. W. Matthiessen, of La Salle, who has expended a large amount of time and money in making it a more attractive spot and in rendering its beauties more accessible to visitors. To this end an extensive system of drives has been constructed, and it was for the purpose of centrally connecting the drives on the east and west side of the canyon that the structure which forms the subject of this paper was designed.

The main canyon above referred to is an immense gorge carved out of the St. Peter sandstone. It extends from the east bank of the river in a north-easterly direction in a somewhat circuitous route, until it has attained a lineal length of something more than a mile. For the first 2,000 feet from the river the side walls are for the most part vertical or overhanging, and rise from 60 to 80 feet above the bottom of the canyon, and vary from 60 to 100 feet apart. The bottom rises some 10 feet in this distance, and at this point rises 55 feet, thus producing a beautiful waterfall. Fifty-five feet beyond the fall the arch is located. The walls here are about 30 feet apart, rise vertically some 30 feet and then slope back at an angle of about 45 degs., and are composed of St. Peter sandstone worn irregular and hardened by exposure.

Preliminary to the construction proper, the sloping sides were prepared by dressing into planes approximately at right angles to the line of thrust. This afforded an excellent natural skewback for the springs of the arch, which were located 33 feet above the bottom, and their position such as to require a span of a little over 40 feet.

The dimensions of the arch are as follows:—Span, 40 feet; rise, 8 feet; curve, circular arch; width, out to out, 16 feet; thickness of ring at crown, 26 inches; at spring, 32 inches; wings, 7 feet long; spandrel walls and wing walls,

16 inches thick inside coping, vertical on outer faces, and battered 3 inches per foot on inner faces; coping, 22 inches wide and 6 inches thick, extending out on each side of walls 3 inches.

To form a platform from which to erect the centres, poles were cut long enough to reach across the canyon, just below the springs. These were put in and covered with plank. The ribs for the centres were eleven in number, each composed of 2 by 14 plank, 10 feet long, sawed on one edge to the proper curve, ends cut radially, and bolted together so as to break joints. Half-inch bolts, with a wrought washer, were used. The pieces were also spiked together. The ribs were built at one side, and then set in place from the platform.

The bearings for the ribs were made by setting a 2 by 12 plank in proper position on each side, and filling in behind with concrete. On one side, however, this plank was set so as to afford about 5-inch spaces for wedges, to facilitate removing the centres after completing the work. These wedges were made of 3 by 12 plank, cut 12 inches long, and sawed diagonally so as to make wedges $2\frac{1}{2}$ by 12 at one end and $\frac{1}{2}$ by 12 at the other. The bearing faces were planed. They were made of hard pine and used in pairs, set between the bearing plank and a plank spiked to the ends of the ribs, a pair being placed at the foot of each rib.

The ribs having been set in place, the exterior ones flush with the sides of the arch, viz. 16 feet out to out, they were crowned with 1 by 6 common fencing, nailed on with ten-penny wire nails. On each side of the centre and nailed to the extreme ribs, boxing was constructed of 1 by 10 dressed boards, nailed to 2 by 4 uprights, the latter tied across about the top of the arch. Two portable partitions were made to use on top of the centre. These were made of 2-inch plank, 16 feet long, carrying a bracket at each end, made of 2 by 4 stuff. These partitions were set $2\frac{1}{2}$ feet from each skewback, thus forming an enclosed space for the first block of concrete. A platform 10 by 16 feet was constructed on each side of the canyon for mixing the cement.

The first block of concrete was now put in in 6-inch layers the full thickness of the ring, when the force was transferred to the opposite side and that end started. By the time the second block was in place the first had sufficiently set to allow the moving of the partition forward $2\frac{1}{2}$ feet for the next block. Thus the work was carried on, alternating from side to side until the completion of the ring. The brackets were so attached to the partition that they could be spiked to the

* A paper read by Mr. C. H. Nicolet, and published from the Proceedings of the Illinois Society of Surveyors and Engineers.

SMOKY CHIMNEYS

"EMPRESS" SMOKE CURE.

The "Empress" Smoke Cure has held its ground with constantly increasing sales for many years, and is now widely recognised as the best chimney-pot. The chimney which the "Empress" will not cure may be considered hopeless so far as any outside treatment goes. It must be reconstructed or the fireplace altered. At least 90 per cent. of smoky chimneys on which "Empress" is fixed are Cured.

FULL PARTICULARS OF SIZES, PRICES, &c., ON APPLICATION TO THE MAKERS—

ESTABLISHED 60 YEARS.

Our Foreman in charge of this Department will attend appointments to examine chimneys and advise. For such attendance in London or suburbs no charge is made. For country appointments railway fares only charged.

centre for each new position and having the force normal to the intrados.

Upon the completion of the ring the boxing for the spandrel walls was built and the construction of the walls carried on, the material being deposited in layers 6 to 8 inches thick. The boxing was made by a carpenter of 1-inch boards, dressed on one side, nailed to 2 by 4 uprights, and so constructed as to meet the conditions of pressure and give the form desired in the finished work. The materials used were as follows:—

Sand.—Ordinary river sand, of fair quality for the kind, taken from the bed of the river and unwashed.

Gravel.—Ordinary river gravel, varying in size from a pea to pieces 3 inches in diameter, and well rounded. It was taken from the bank or dry bed of the river, and well washed in the river water before taking to the site. It will be seen that the sand and gravel were not all that could be desired in such work. The gravel was especially unsatisfactory, but it was believed that by taking care to cleanse well and thoroughly mixing and tamping good results would follow. This was possible, as the work was carried on by day labour under a trusted foreman.

Cement.—Portland, brands Offenbach & Pommerscher (Stettin) in the ring and coping and letica in the walls. The proportions used were as follows:—Portland cement concrete 1 cement, 3 sand, 5 gravel; for the letica cement concrete, 1:2:4. The materials were incorporated by first mixing the cement and sand dry, tempering thoroughly with a limited amount of water and spreading. The gravel was then added in a layer on top, and the whole then turned with shovels until fully mixed—usually accomplished in three turns. The mixing was done in batches of a size made by one borne of cement, and each batch was thoroughly tamped in 6-inch layers when put in.

The coping was surmounted by a railing made of two lines of 1½-inch wrought-iron pipe, with uprights of same pipe about 8 feet apart, set 1 foot into the concrete. The lower ends of the pipes were filled with cement as a precaution against collecting water and freezing. At the foot of each post was placed a large o.g. cast washer to give a more finished look.

This work was closed up November 15, 1894. Frosts had set in before the ring was completed. No precautions were taken to prevent the freezing of the concrete. No fears were entertained for the Portland cement work, but doubts were felt as to the outcome of the spandrel walls, as these had been made of natural cement. There were good reasons

for completing the concrete work, however, at that time, and it was done. Parts of the walls were subjected to severe frosts within a few hours after building.

The boxes, centres, &c., remained on the work through the winter, and were removed on the advent of settled weather in the spring. The Portland cement work was in remarkably good shape. The walls, however, showed the effects of the frost on the outside, and in places it was necessary to scrape off the injured material to a depth of 3 inches. This, however, was the exception, as ordinarily only a skin coating was injured and had to be removed. This done, all the surfaces were washed with a hose jet and a coating of Portland cement mortar pressed home over all of them, the surfaces that were scraped out having first been built out.

The wedges used under the centre were readily removed, easing each a little at a time.

A recent inspection of the work after two years shows no cracks or faults whatever nor any loosening or peeling off of the coating put on in the spring of 1895. At the time of completing the work measurements were taken across the roadway over the spring lines to known points on opposite copings. The spandrel walls are highest at these points. A recent test shows the same measurements, and from this it is inferred that the work in the walls is permanent, notwithstanding the unfavourable conditions at the time of their construction.

The filling over the arch to form a roadway was of gravel and soil, put on in the spring of 1895, and surfaced up to a depth of about 1 foot over the crown.

The form of centre used made a very stiff structure. Levels were taken with a view to detecting any possible rise of the crown as the haunches were built out, but no change of level could be detected.

THE BIRMINGHAM MEAT MARKET AND SLAUGHTER-HOUSES.

ON Wednesday the Lord Mayor of Birmingham opened the new market buildings, which in completeness are unique in this country. They were erected from the designs of Messrs. Essex, Nicol & Goodman, which were reproduced in *The Architect* at the time of selection.

The wholesale meat market hall is the largest and the

The **FINEST EXAMPLES.**

central building of the block running from Bradford Street to Cheapside, and separated on either side from the slaughtering establishments by a covered roadway for carts and waggons. The position and dimensions of the market hall, together with its roadways, are as decided by the committee in consultation with the consulting architect; both ends are out of square, one side being longer than another owing to the necessity for the twenty slaughter-houses on the one side being made as wide as possible. The difficulty of roofing so large a space with hipped ends has been got over by the introduction of a long column at both ends, which carries a lattice girder supporting the irregular rafters. The only objection to the arrangement is that externally the end of the building next Bradford Street is not parallel with the water tower, but practical and economical reasons have prevailed in this matter. The eaves of the roof project beyond the line of the wall to keep out the direct rays of the sun as much as possible; the roof lights are continuous, having also projecting eaves.

The hall, which is almost identical in proportions with the old retail market hall in High Street, is 365 feet long and 90 feet broad, the height of the side walls being 35 feet, and the height to the ridge 65 feet. It is fitted for hanging over 3,000 sides of beef in seventy-three market stands, and is divided by two longitudinal and three cross avenues.

This market is one of the first establishments where a complete system of overhead travelling rails has been carried out. The meat, on being hoisted to roller hook height, may remain suspended while being conveyed to and from the market. The meat may be taken to any of the seventy-three market spaces for sale, travelled to the covered roadways for carting away, or on to the lifts and taken down, still suspended, to the chill-rooms in the basement, from which it may subsequently be returned in the same way.

Considerable trouble has been taken by the committee and the architects to obtain the best system of travelling rails and switches, the ultimate decision lying between a foreign system of twin travelling rails with catch point switches and the usual single rail, fitted however with balanced rising lever bridge switches, manufactured by Messrs. Kesson & Campbell, of Glasgow; the latter system being chosen on account of its simplicity.

The market hall is fitted with 1,216 incandescent electric lamps of 32 and 25 candle-power, and 57 lamps of 50 candle-power.

The salesmen's offices are placed in the centre of the hall

over the stands, so as not to take up the floor space below, and are approached by two staircases, under which are the public scale offices.

Two hydraulic lifts in the centre of the hall communicate direct with the cold stores and chill-rooms, which have been constructed in the basement. The floor of the hall forming the basement ceiling is constructed of suspended concrete.

The buildings adjoining Sherlock Street East consist of superintendent of markets and meat inspector's offices, caretaker's house, mess-rooms, stable and van yard, and hide and fat stores. On entering by the cattle entrance in Sherlock Street East, immediately in front is a row of twenty slaughter-houses for wholesale salesmen. Each slaughter-house is fitted with the necessary apparatus for two sets of men to work at one time.

These twenty slaughter-houses are fitted with 119 incandescent electric lamps of 32 candle-power each, and 97 of 50 candle-power each. In the yard outside the slaughter-house doors are pens for animals about to be slaughtered. Lairage for about 200 beasts is provided over the slaughter-houses, and for about 500 sheep over the block of offices, &c., adjoining Sherlock Street East. Access to the lairage is obtained by a sloping way leading from the yard. This sloping way is divided into three parts, one up and one down, with a drover's passage between. At the Cheapside end of the yard a hydraulic lift is provided, to be used in connection with the lairage, for casualties or as may be required.

A general view of this range of buildings will illustrate a very important point, namely, the drainage. From the concrete floors of the lairs the drainage flows into open iron troughs running along the outside wall. From these it descends by iron shoots into shallow open channels in the pavement of the yard. The slaughter-house floors are arranged so that the swillings flow directly into open gutters and so into the channels outside. At the boundary wall a catchpit is provided. This has three levels, with meshed screens successively increasing in fineness, so that practically all solid matter is removed before the drainage reaches the sewer. Nowhere in the place is there any pipe connected with the public sewer. In fact, there is not a single pipe drain except in the basement, where, owing to the shallowness of the sewers in the neighbourhood, pumping is necessary. The solid refuse must necessarily be removed promptly by hand, since otherwise it will accumulate and form not only a nuisance, but an obstruction. To facilitate the systematic cleansing of the floors and channels

MASSIVE CARVED ANTIQUE OAK SIDEBOARD, the upper portion fitted with bevelled edge plates, with shelf supported on carved brackets, a richly carved panel below, the lower part fitted with three drawers on one side and a cupboard with shelf in the centre on the other, 4 ft. 6 in. wide, £5 18s. 6d.

ALL CARPETS MADE UP FREE OF CHARGE.

and the removal of refuse, a small trolley runs along rails in the yard adjoining the slaughter-houses.

Access to the basement is by a subway passing from the slaughter-house yard on the north side, and connected through with a roadway opening into Bradford Street and Cheapside on the south side of the site.

At the Bradford Street end of the basement and underneath the wholesale market hall is placed the electric light engine-house, containing three 85 B.H.P. Crossley gas-engines running at 200 revolutions per minute, and driving by means of belts three dynamos for generating electric energy at 200 volts pressure. There is space for a fourth engine and dynamo, which will shortly be required, as the market will be more fully occupied immediately after the opening than was originally anticipated.

The engines are started by means of compressed air, and the cooling water is circulated by electrically-driven pumps. The wiring throughout is on the concentric system, requiring no wooden casing; and being waterproof and safer than ordinary wiring laid in wooden casing, is particularly adapted for the purposes of this building. Storage batteries are provided for lighting certain portions of the building when the engines are not running. The total cost of the electric-light installation is about 10,500/. The work has been engineered by Messrs. Henry Lea & Thornbery, of Birmingham, the contractors being Messrs. Mavor & Coulson, Limited, of Glasgow.

The Linde British Refrigeration Company, Limited, having leased from the Corporation about two-thirds of the market hall basement, have fitted up, adjoining the electric light engine-room, an engine-room containing three gas engines, ammonia compressors, together with a dynamo for their own electric light and motors. The cold stores and chill-rooms have also been constructed by the Linde Company, and will accommodate about 25,000 carcasses of mutton and 300 sides of beef.

On the left side of the roadway leading from the basement to Cheapside is a continuous block of buildings placed along the southern boundary of the site. On the lower floor of this block, starting from Bradford Street end, is the boiler-house, containing two large Lancashire boilers for supplying hot water and steam for all purposes connected with the slaughtering of cattle and treatment of tripe, ropes, &c. Steam is conveyed to steam heaters situated in the various departments from which hot water is supplied through taps in each slaughter-house or other compartment. Steam is also conveyed to the scalding tubs in the pig slaughter-hall. Power is also obtained from

these boilers to work two small pumps connected with the drainage of the basement, which is below the level of the Bradford Street sewer. Adjoining the boiler-house is a small slaughter-house and a room for condemned meat.

On the ground floor, at the Cheapside end of this block, and immediately opposite the pig slaughter-hall, is a lairage capable of accommodating about 200 pigs. The first floor of this block of buildings is set apart for the treatment of tripe, ropes, blood, &c., and is connected with the yard opposite by two small bridges, and with the ground floor by a sloping way at the back.

On the south side of the Market Hall, and on the right-hand side at the top of the roadway leading from the basement to Cheapside is the pig slaughter-hall. This hall is 96 feet long by 40 feet broad. It is divided, so far as its roof is concerned, so as to collect the steam arising from the scalding tubs. Pens are provided outside the hall with special doors opening into small pens inside, immediately in front of which the scalding tubs, six in all, will be placed. The pigs will be scalded, scraped and dressed on one side of the hall, and the carcasses hung on the opposite side. The gearing and fittings are arranged for twelve sets of men to be working at one time. The slaughter-hall for beasts, sheep, calves, &c., is the continuation of the same line of buildings, completing the block from Cheapside to Bradford Street. The fittings are arranged at present for twenty-six sets of men, the slaughtering to take place on one side of the hall only. Should more accommodation be required the other side of the hall may also be fitted for slaughtering. A portion of this hall, at the Bradford Street end, will be partitioned off, fitted up and used as an offal market. These halls are constructed on the system principally adopted on the Continent, where slaughtering is generally carried on in large open halls. Over the large hall and approached by two sloping ways, one up and one down, from the yard at the rear, is lairage accommodation for about 200 beasts and 500 sheep, &c. Lavatories, &c., are placed in convenient positions in the yards at the rear of both blocks of slaughter-houses. At the Bradford Street end of the yard adjoining the slaughter-halls is the water tower. This contains at the top a tank 20 feet deep, holding about forty-five tons of water. About one day's supply of water will here be kept as a reserve. A large rainwater tank is also placed in the tower, and this with four other tanks placed in various positions on the site is intended to serve the double purpose of stopping the rush of stormwater from the roofs, so as not to overcharge the drains

in the adjoining streets and of supplying water for flushing purposes.

The first act of the ceremony on Wednesday was the presentation by Mr. J. Coulson Nicol, under whose personal superintendence the buildings have been erected, to the Lord Mayor, on behalf of the architects (Messrs. Essex, Nicol & Goodman), of a handsome silver-gilt key, specially designed by them as a souvenir of the occasion.

CAMPSBOURNE SCHOOL, HORNSEY.

THIS new school, which was opened by Mr. H. C. Stephens, M.P., on the 23rd inst., has been built upon a site acquired some time since by the Hornsey School Board, which contains an area of 2 acres 1 rood, and which has the advantage of entrances from Boyton Road and Eastfield Road, with frontages to Newland Road on the north and to the proposed extension of Nightingale Lane on the west. With so large an area the question of the plan for a school to accommodate over 1,400 children at once arose, and under the advice of their architect the Board decided to erect the building in two blocks—one to contain a two-storey building for the girls and boys' department, and the other a single-storey building for the infants. This scheme was not adopted until it had been thoroughly thought out, and as the Board were advised that such buildings would be somewhat cheaper than a three-storey building, this plan was decided upon and the Education Department at once approved of the same.

Beyond the above two blocks a caretaker's house has been erected at the entrance from Boyton Road, and separate buildings have been built for manual instruction and for cookery teaching. Each of the three departments is provided with a separate hall for assembling and other purposes. The girls' department is situated on the ground floor of the two-storey building, and contains accommodation for 450 scholars in eight classrooms, which are grouped round the central hall. This hall is 86 feet long by 28 feet wide and 15 feet high in the clear, being well lighted from the ends as well as from borrowed lights from the classrooms. At the south end of the hall cloak-room accommodation is provided, and at the north end a head mistress's-room and lavatory.

The approach to the boys' department, which is situated on the first floor, is from the north end of the building by two fire-

proof staircases. This department is a duplicate of the girls' department and will contain the same number of scholars.

The roof to the large hall on the boys' floor has been constructed as an open timber roof, which gives the hall increased height and character. Assistant masters and mistress's rooms are provided on the mezzanine floor of this building, and caretaker's store-rooms.

The infants' block provides accommodation for 510 scholars in seven classrooms, and a large assembly hall measuring 50 feet by 25 feet is also provided for their use, with cloak-rooms and lavatories in convenient positions. On the level of the classrooms is a head-mistress's room, and on the mezzanine floor a cheerful room has been provided for the assistant mistresses. One of the features of this department is a baby's room fitted with circular galleries on the lines of a theatre, to facilitate the teaching of very young children. The manual instruction room contains accommodation for twenty-four scholars, and beyond ample space for the benches a gallery is provided for teaching purposes, with a cloak-room and wood-store adjacent.

The cookery kitchen contains accommodation for forty scholars at a time, and a scullery has been erected adjacent to the kitchen. Cloak-room accommodation is also provided for this building.

The whole of the classrooms throughout are heated with "Boyd's" patent hot air stoves, and the halls and corridors by a low-pressure hot-water apparatus worked by boilers situated in the basements of each block of buildings. All the classrooms are designed so as to be lighted from the left hand, and all have full provision for fresh air inlets and extract flues from each room. The buildings externally have been carried out in stock brickwork, with red brick dressings and red "material" finishings. Internally the walls are built to a dado height in brown salt-glazed dipped bricks, and above such dados are finished with buff Gamlingay bricks. The lighting has been supplied by gas, the "Clapton" lights being used throughout.

The drainage has been carried out on the most approved principles, from the architect's drawings, the closets and lavatories used being those manufactured by Messrs. Adams & Co., of Old Queen Street, Westminster.

The amount of the contract for the works was 20,467*l.*, including the whole of the accessory buildings and the playground walls and finishings, which works out at the reasonable cost of 14*l.* 10*s.* 3*d.* per scholar, and including the cost of the fine freehold site the sum is 15*l.* 18*s.* 8*d.* per scholar.

AGENTS APPOINTED IN ALL LARGE TOWNS.

Comparing this cost with that of recent School Board schools it will be seen that it is a low one, and justifies the advice given by the architect to the Board as to erecting the buildings on the principle he advised.

The whole of the works have been executed by Messrs. Kirk & Randall, of Woolwich, from designs prepared by Mr. Howard Chatfield Clarke, of 63 Bishopsgate Street Within, E.C., under whose personal direction the works have been carried out. The heating was supplied by Mr. W. J. Fox, of South Place, Finsbury, E.C. The lighting and the whole of the gas-fittings were carried out by Messrs. Strode & Co., of Osnaburgh Street, N.W., and the hot-air grates were supplied by Messrs. Hendry & Pattison, of Marlborough Mews, Oxford Street. Mr. W. White, the clerk of works to the Hornsey School Board, has very efficiently carried out the duties appertaining to his office.

THE NEW CHRIST'S HOSPITAL.

ON Saturday, October 23, the foundation-stone of the new buildings at Stammersham was laid by the Prince of Wales. The trowel employed was that with which the then Duke of York laid the foundation-stone of the new hall of Christ's Hospital on April 28, 1825. The site of the buildings is about two miles from Horsham. The land, which has an area of nearly 1,200 acres, belonged to the Aylesbury Dairy Company, who were glad to sell it for about 53,000*l.*, being some 20,000*l.* below the sum it cost the company. For school purposes 150 acres were assigned, two farms have been let, and the remainder will be cultivated under the direction of the agent. Roads have been formed and a station is to be erected.

Experts differ about the suitability for school buildings of a site which consists of such deep clay as is found at Stammersham. Mr. J. W. Penfold, the surveyor appointed by the Charity Commissioners to inspect the property previous to its purchase, reported under date of May 30, 1892, that:—"Geologically it stands in the Wealden clay, but hereabout it has been partly denuded, and the result is that the arable land is a fairly light soil, working with a pair-horse plough." The late Ewan Christian in his report dated May 27, 1892, says:—"After a complete survey of the area comprised within its boundaries, I have no hesitation in saying that it is admirably adapted for the purposes in view. It is remarkably open, and while possessed of considerable beauty of position in respect of more

distant views of the Surrey Hills in one direction and the Sussex Downs in another, there is over the whole a general brightness from an uninterrupted expanse of sky, and a freshness of air from the vicinity of the sea which cannot be otherwise than favourable to healthfulness. Agreeable undulations of surface and good plantations of trees also combine in giving excellent positions for buildings, with great advantages in respect of aspects, and all requirements of pleasant and healthful residence." Mr. Rogers Field reported less favourably than the surveyor and the architect of the Charity Commissioners, and advised, on January 10, 1894, that a boring be sunk to ascertain the quality of the water in the "Tunbridge Wells Sand" lying beneath the estate, the supply from the then existing shallow wells being surface water and liable to contamination.

The school buildings are to be erected from plans by Mr. Aston Webb and Mr. Ingress Bell, which were obtained in competition. The construction of the new buildings is to be of the simplest character; red brick and stone are used for the walls, and red Broseley tiles for all roofs except the hall and chapel, which it is proposed to cover with Westmoreland slates. The whole scheme suggested by the Council has been carefully thought out by the architects in every particular, in the light of a personal knowledge of what has been hitherto done in designing public schools; and great care has been exercised in the matter of cost, there being no redundant ornamentation or embellishment involving periodical outlay. For financial reasons it has been found necessary to build at present for 600 instead of 820 boys. But the recent restoration of the Donation Governors' privileges has already attracted several new Governors, and will, it is hoped, induce many more gentlemen and ladies of means and benevolence to come forward, as of old, with the qualifying donations of 500*l.*; and when the valuable site in Newgate Street comes to be developed the Council trust that the sum realised will enable the buildings to be completed in accordance with the original designs, so that the numbers relieved by this noble charity may be restored to their former height.

There is to be a quadrangle, which will be larger than the great court of Trinity College, Cambridge. Cloisters will run along each side of the square, and the working portion of the school will be placed in the buildings on the several sides of the square. The dining-hall, to accommodate 800, will be on the north; the library, science and art schools, museums and laboratories will stand at the east; the chapel, with seats for 1,000, on the west; and on the south will be the school-hall and

classrooms; a music school and gymnasium will also form part of the scheme. The style is described as late Tudor or early Jacobean, with mullioned windows, and it has been sought to combine the freedom of Gothic with a limited use of detailed ornament of Italian character. In addition to the school buildings proper, six blocks are to be erected, each divided into two boarding-houses, and in each house fifty boys will reside. Though detached at the ground level, the blocks are connected by a subway, so that the staff from each may reach their dining-hall without traversing the boys' routes. These subways, which are ventilated and daylighted throughout, contain all the pipes, mains and electrical wires for facility of examination and repair. Provision is, of course, made for the addition of further houses. In so great a community it has not been forgotten that an infirmary and sanatorium may from time to time be wanted, and these have been placed at the eastern end of the range of house blocks.

It is claimed for these new buildings that they will be the first great public school in which the modern system of isolation will have been thoroughly carried out. Every room is to have a southern aspect, and the aim throughout has been to secure the greatest possible amount of sunlight and the freest circulation of fresh air. There are to be no dark corners, even in the corridors, and in addition to providing for the amplest access of light and air, it has been sought to avoid congestion of traffic. Servants' routes are separated from those used by the boys, and lateral doors will facilitate the exit from halls, schools and classrooms. The builders are Messrs. Longley, of Crawley, and the cost is estimated between 280,000*l.* and 300,000*l.*

SANITARY INSPECTORS' CONFERENCE.

ON Saturday last a Conference organised by the North-Western and Midland Sanitary Inspectors' Association was held in the Council Chamber, Birmingham. Nearly a hundred inspectors attended, among them being Messrs. W. Urquhart, Crewe (president of the Association); W. Wilkinson, Derby (president of the Derbyshire Association); and J. T. Cowderoy, Kidderminster (president of the Worcestershire Association).

Alderman Cook (chairman of the health committee) welcomed the visitors, and said he noticed in a circular which had been issued in connection with the Conference a statement that it was generally admitted that the present position of

sanitary inspectors was most unsatisfactory, and that urgent reforms were needed. He did not know what that meant; he did not think it applied to Birmingham. They were always very desirous to acknowledge that the work of a sanitary inspector was one of very great importance to the public health, and they wanted the men in that position to feel the responsibility and the importance and the dignity of their work. The staff of health officers in Birmingham comprised one chief inspector, nineteen assistants, four smoke inspectors, one lodging-house inspector, one inspector of canal boats, one milk-shop and dairies inspector, one workshop inspector, one inspector under the Food and Drugs Act, four clerks and four disinfectors. During the past year over 3,000 houses had been cleansed, purified and disinfected after cases of infectious disease, over 1,100 houses had been cleansed and whitewashed and above 1,400 repaired. Altogether the department had dealt with 20,000 nuisances. In Birmingham they had about 32,000 pan-closets, 40,300 water-closets and 5,000 ashpits, the latter of which they hoped would very soon disappear.

The President acknowledged the welcome tendered by the civic authorities, and expressed his admiration for Birmingham as being among the pioneers in sanitary work.

Mr. W. Wilkinson, chief sanitary inspector of Derby, introduced the first subject on the programme, which was whether sanitary inspectors ought to be under local or State control. The speaker was emphatically in favour of exchanging local control for State control, on the ground that the inspector should not be placed in the position of supervising his own masters. He said it had been his unfortunate position to have to take proceedings against members of his own sanitary committee, ex-mayors, aldermen and so forth, and he contended it was not fair to put a man in such a dilemma that he had to choose between shirking his duty and jeopardising his tenure of office. He knew of instances where officers had suffered the whole of their lives through the fearless discharge of their duties. Mr. Wilkinson asked the officers present who had had to take proceedings against members of their own sanitary authority to hold up their hands, and about a dozen hands were shown. Those who had not had occasion to take such proceedings were then asked to signify the same, and about an equal number responded. Mr. Wilkinson drew the conclusion that there were many present who would rather not answer the question.

Mr. W. H. Coney (Wednesbury) read a paper on anomalies of public health laws, and submitted suggestions for reforms

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact **it will Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish. Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION.

therein. He advocated a consolidation of the existing Acts, the bestowal of greater freedom of action on sanitary inspectors, and the abolition of the permissive element in the law relating to nuisances, which he contended hampered the health officers and greatly lowered the efficacy of their work. He was in favour of the creation of a national board of health on similar lines to that formed in 1848, but possessing higher powers, its President to have a seat in the Cabinet. He also pleaded that there should be one name for "nuisance inspectors" and "health inspectors," viz. that all should be known as "sanitary officers," and that the possession of a certificate of competency in sanitary law and practice should be a condition of appointment. The superannuation of sanitary officers also received a prominent place in the programme of reform set out in the paper, and Mr. Coney concluded by moving a resolution in which his points were summed up.

This was seconded by Mr. John Hughes, and after a discussion, in which Messrs. Branson and Bland took part, it was put and carried.

Mr. J. Lowry (Seisdon) introduced a discussion as to the desirability of promoting a special Bill for the superannuation of sanitary inspectors. He criticised the Birmingham scheme of superannuation referred to by Alderman Cook at the opening of the proceedings, ridiculing the allowances offered as utterly inadequate.

Alderman Cook said Mr. Lowry had misconceived the position as he explained it. The Birmingham scheme applied to the whole of the officials and employés of the Corporation, even to the night-soil collector. He thought it was the most liberal scheme of superannuation he had ever heard of. As to the statements made by a previous speaker concerning the interference with the inspector's duties by interested property owners who were members of sanitary authorities, he thought if anything like that took place in Birmingham, public opinion and the feeling of members of the Council too would at once cause the offending member to be removed.

Mr. Wilkinson then moved:—"That this conference of sanitary inspectors is of opinion that the duties undertaken by inspectors are of such a dangerous, onerous and important character that, in the interests of the public health and justice to the officers and those dependent upon them, some provision should be made for superannuation under central or Government control, and that a special Act should be introduced at once to secure this."

Mr. Bland seconded.

A subsequent speaker stated that in discharging his duties he had contracted smallpox once and scarlet fever twice.

Dr. Hill, who was very cordially greeted, asked leave to say a few words. He declared his sympathy with the desire of sanitary inspectors to improve their position, but said he could not help thinking some of the views which had been expressed in the course of the discussion, and the claim to a special Bill, were a mistake. Why should the inspector of nuisances have an exceptional Bill all to himself? He talked of the labours he performed and the danger he incurred, but there were others who had to work hard, and who ran risks—medical officers, superintendents of hospitals, nurses—in fact, the inspector of nuisances ran very much less risk than many other people. Why were they not content to throw in their lot with other officials in demanding superannuation?

Mr. Cowderoy said that when medical officers of health met to discuss their own concerns as a class they sat with closed doors, and would not think of allowing a sanitary inspector to obtrude his opinions in their deliberations. As to the risks involved in their avocation, he had never heard of a case in which a medical officer of health died through following his duties, but he had heard of cases of sanitary inspectors meeting their death through having to remove smallpox patients to hospitals. He contended that there was a sound case for special treatment, and was satisfied their movement would receive a large amount of support in the House of Commons.

In the course of further discussion, it was stated that under a scheme which had been formulated sanitary officers would themselves largely contribute to the superannuation fund.

Mr. Wilkinson, in reply to Dr. Hill, said sanitary officers did all they could to advance the general officers' Bill promoted some time ago, but that having failed, they felt they were quite within their rights now in pressing their own special claims.

The resolution was then put and carried.

The Conference concluded with a discussion on the advisability of unity of action among sanitary inspectors and the most effective means of securing it, the subject being introduced by Mr. Bland.

ARTISTIC IRONWORK.

A VERY handsome addition has been made to Holy Trinity Church, Stroud Green, in the form of a wrought-iron chancel screen and gates; also screen and gates to side chapel. The style adopted is thirteenth-century. The main screen is 31 feet 6 inches wide and 24 feet high to top of central cross. It is divided into nine bays, each with Early English arches, to enable one to have a clear view of the chancel. The upper part, which suggests the form of the early rood-screens, is connected with some very elegant foliage and tracery. The main columns supporting central arch, and also the two end

ones, are made up of clusters of pillars filled in with foliated dog-tooth ornament; the caps of same are enriched with delicate and artistic hammered foliage, their columns being surmounted by canopies, in which are figures of St. Mary and St. John and two angels. The figure of Our Saviour is in a vesica over central arch, above which is a gable surmounted by a foliated Latin cross. The ironwork is finished black and picked out with gold; the figures are also gilt. The work has been executed in a most artistic manner by Messrs. Jones & Willis, of London, Birmingham and Liverpool.

THE RECONSTRUCTION OF BOMBAY.

A SANITARY enterprise on a vast scale is announced from Bombay. The Government has laid before the municipality, says the *Times*, a scheme for expending 50 million rupees on bringing up the house accommodation of the city to the standards demanded by the laws of health. This sum is apart from the outlay already devoted to waterworks and drainage—an expenditure enormous in the past and still going on to an extent that will exhaust even the liberal powers of borrowing granted by law to the capital of Western India. The Government is aware of this fact, and is prepared to make special provision not only for providing the funds, but also for the conduct of the new work. As Baron Haussmann reconstructed Paris from the point of political control, so Lord Sandhurst proposes to reconstruct Bombay from the point of view of sanitary safety.

In replying to a deputation of the Bombay Chamber of Commerce last February, his lordship referred to the urgent need for opening up the congested quarters of the city, for the removal of pestilential dwellings and for the prevention of over-

NEW public baths and washhouses were recently opened at Hutesontown, N.B. The building has cost about 5,000*l.*, and consists of fourteen hot baths—four for women and ten for men. There are thirty-four washing stalls in the washhouse, with a similar number of drying horses and three hydro-extractors.

crowding in the future. Three-quarters of the population of the city are said to be crammed together in "chawls" or rookeries, some of them five to seven storeys in height, and run up in defiance of every principle of hygiene. Long interior passages, or rather burrows, go from end to end of these buildings on each floor, giving access to the rooms, "for the most part small and wholly unventilated," in each one of which a whole family may live or die. The passages are quite dark, except where they open out on a gully, which serves as a sewage drain. Often they have no opening at either end, and the rooms may or may not have little windows. From 500 to 1,000 persons are sometimes squeezed into one of these pestiferous rabbit-warrens, a prey to infection themselves and a standing danger to the health of the city. We condense the above description from an account published at the beginning of this month. The truth is that the population of Bombay has rapidly outgrown the accommodation existing for it, and the problem before the Government is how to provide decent house-room for nearly half a million of people living as no human beings should live.

Lord Sandhurst's plan, whatever may be its financial results, is conceived on a scale commensurate with the evil to be dealt with. It first provides for opening out crowded localities by the construction of new streets and for the creating of new house areas by levelling up low-lying localities and by reclaiming considerable tracts from the tidal waters. Having thus secured new space, it next provides for covering it with tenements to be let at comparatively low rents and for improving the old unhealthy rabbit-warren in which 75 per cent. of the population is said to be now dwelling. More space and more air are the two main objects which it keeps constantly in view; and it has the merit of providing beforehand for the displacement of poorer inhabitants which any attempt to deal with their overcrowded barracks must at once involve. Fortunately there are tracts in and immediately around Bombay which admit of being utilised for the purpose. These tracts, some of them filthy swamps within tidal limits of the sea, have long been a source of danger to the health of the city. Lord Sandhurst proposes, among other works, to convert these low-lying hot-beds of disease into well-raised areas for human habitation.

Of the 50 million rupees which the scheme is estimated to cost, rather more than one-half will be devoted to cutting new streets through congested districts of the town, somewhat less than a third to reclamations or levelling, and the remainder to erecting tenements for the poor. The figures provisionally accepted by the Bombay Government in its resolution of September 29 are as follows:—

New streets opening out crowded localities .	Rs. 2,70,00,000
Reclamations	1,25,00,000
Chawls for the poor	83,00,000
Levelling and laying-out vacant lands	17,00,000
Total	Rs. 4,95,00,000

The expenditure of this large sum and the construction of the works might seem to fall to the Municipality of Bombay. But Lord Sandhurst, whilst acknowledging the good work done by that Corporation, sets forth weighty reasons which render it expedient that the present scheme should be carried out by a special machinery of its own. It may be questioned whether such a task comes within the range of duties contemplated by the Bombay Municipal Act. It cannot be questioned that its cost lies beyond the present financial resources of the Bombay Municipality, already pledged to sanitary works almost up to the extent of its borrowing powers.

Lord Sandhurst desires to create a board of trustees for the purpose on the general lines which have been found to work so well in the case of the Bombay Port Trust. The Municipal Corporation will be strongly represented on the board, but care will be taken to also secure the fair representation alike of the landed proprietors, of the general body of citizens, and of the Government, which will itself have a very large stake in the enterprise.

The Bombay Improvement Trust will be enabled to raise its capital at the low rate of interest which a Government enterprise in India can obtain. It will also start with a large area of Government land, transferred for the purposes of the scheme. The present value of these Government lands and of their reclamation rights is estimated at over 9½ million rupees, together with the municipal lands, valued at nearly 3 million rupees, making a total of 12½ millions of rupees' worth of land rendered available for the objects in view. The Government will, in fact, make over almost the whole of its landed property in Bombay to the Improvement Trust for the benefit of the citizens at a low rate of interest, calculated upon present values. During the first ten years the Government will charge nothing. "The Trust shall have the rents from the reclaimed areas for the first twenty years, and afterwards subject to a small charge on the market value, less the cost of reclamation." The capital will be raised gradually as required. The Government estimates that the scheme will not at any time involve an addition

to the municipal rates of more than 2 per cent. on the assessable value of properties, and it contains possibilities of becoming a source of financial strength in the future. The project must be primarily regarded, however, not from the point of view of contingent profits as a speculation, but with reference to immediate benefits which it will render to a great city that has outgrown its house-room. Among those benefits will be, not only more adequate accommodation for the overcrowded poor, but also new areas for the European and well-to-do native inhabitants, who at present pay fancy rents for the sites available for their dwellings.

THE CONDITION OF POONA.

THE Collector of Poona recently appointed Surgeon-Major Barry to investigate the sanitary condition of the city of Poona, and a very long report from that officer has now been published. It discloses an extraordinary condition of affairs. It opens by stating that under its present municipality the city has fallen "into the groove of chaos, of incompetence, inefficiency, waste, absence of check and wanton disregard of public obligations towards the poorer class of citizens." Dr. Barry deals with his subject under fourteen heads; but only very few of these can be mentioned here. The night soil has to be removed in carts through public thoroughfares over three miles from the city to the poudrette factory, and it is therefore "important that the carts should be in first-class working order, not liable to break down, outwardly clean and with valve fittings calculated to stop effluvia." Dr. Barry examined the carts in every single dépôt and called in the collector to witness the accuracy of his statements. He found that not one cart was in working order, and he mentions cases where full carts have broken down in the streets and been allowed to remain for days without removal. Owing to neglect in emptying cesspools and other neglects, which Dr. Barry mentions in detail, he describes Poona as lying on a bed of sewage; the surface gutters are a mere device to hide filth; rubbish is not removed, and it was a common occurrence to find the dustbins overflowing and surrounded by a rampart of filth which was not removed for four or five days together; the number of dustbins was not half what it should be; all the open places of the city were laid out in filth; the back lanes seem to have never been inspected. The wealthy quarters are nearly as bad as the poor ones. "A walk down Sadashiv Peth, our local Belgravia, is a liberal education in Oriental hygiene—light minus sweetness;" and he describes some of the abominations amongst which wealthy and influential natives seem content to live. He mentions that he has seen the city engineer's men seeking for an obstruction by digging up the public thoroughfares, and not merely failing to find the obstruction, but failing to hit on the drain at all. Indeed, both the health officer and the engineer of the municipality fare very badly at Dr. Barry's hands. He devotes a special section to the condition of a particular quarter, called the Maharwada, where thirty deaths from plague occurred in a group of fifty-four houses. The description of this quarter is revolting; the inhabitants told him that they had represented their state to the municipality, but without avail. Dr. Barry grows very indignant at the state of the Maharwada, and says:—"When I recall the unctuous upbraidings addressed to Government from time to time by the very men who are running this municipality, urging upon Government to have bowels of compassion for the poor, the picture of the Maharwada—the poor at their own doors—discloses the shameless cant and humbug of it all. The Brahmins of Poona have had for years an absolutely free hand. They manned the municipal service up to the hilt with their own caste, and the result is a pitifully incompetent executive. . . . If I have succeeded at all in engendering some conception of the conditions that have come under my eye, then it must be seen that the Poona municipality is a paper municipality, its work is paper work, its men are men of paper, except where they are men of talk. If I describe Poona as a blank in everything except a pay-sheet, I am not dropping into paradox, for the amount of performance is infinitesimal compared with what it costs to produce it. They can have no real wish to see good work done, for they are careful not to put good men to do it. To make a parade of activity they issue rules and orders and frame contracts to bedizen a report, and there they leave it." The answer of the municipality, which was adopted at a meeting at which only seven members were present, is also very lengthy, and is accompanied by a letter from two Mohammedan members, who express their concurrence in the main part of Dr. Barry's report, and advise the appointment of a European executive officer at the head of municipal affairs as in Bombay. Under many of the heads, and these the most material, the answer substantially admits the allegations and gives excuses for the horrible condition of things disclosed. There is no positive denial of any of the statements of fact above referred to; it is not admitted that the Maharwada is any worse than such quarters in other cities; it is a dark spot in Poona, no doubt,

but then Bombay has her dark spots and enough of them, and the cities of England have their dark spots. The answer, however, practically endorses all that Dr. Barry has written as to their two chief officers, and says that one of them has been reprimanded.

THE DANTZIG TIMBER TRADE.

ACCORDING to the report of the British Consul at Dantzig, a remarkable change is to be noticed during the last few years in the increasing demand in the provinces forming his consular district for articles made in Great Britain. This applies more especially to luxuries, which hitherto the German did without, or was satisfied with the inferior qualities produced in his own country. The shops give great prominence to goods manufactured in Great Britain, and the shopmen always carefully explain that they are of British make, and superior to similar goods made elsewhere. The British imports would be larger if a better system were adopted. "The contrast between the way the British merchant seeks new trade channels in Prussia and that of his foreign rival is so marked," says the Consul, "that I mention it in the hope that a change may soon come over my countrymen's mode of action. The British subject obtains from his Consul or from a directory, most probably out of date, a list of the local traders who deal in what he wants to sell. These he bombards with price lists in the English language, which they cannot read, and then he is astonished that they pay no attention to his communications. The foreign rival, on the contrary, sends a traveller here, speaking German fluently, who calls on these same traders with samples and explains to them how the goods can be forwarded to them with the least possible delay and expense, and extols his wares to such an extent that he seldom leaves without getting an order. The Dantzig consular district, which is about the size of Ireland, is so well worked by commercial travellers, one succeeding the other almost daily, that those who try to do business any other way are hopelessly out of it."

The prosperous condition of trade in 1896 all over the world was also felt in the wood trade of Dantzig. The stock remaining over from the preceding year was cleared off at remunerative prices, and altogether business in timber of all kinds was very satisfactory to all concerned.

The rafts of wood which were floated down the river Vistula to Dantzig in 1896 were 20 per cent. more in value and one-third greater in quantity than those brought down from the

forests in 1895. This increase is mainly in the low-priced qualities. Of fir sleepers alone 290,623 in number more reached here than in the preceding year. This accounts for three-fourths of the increase. Oak sleepers are not so much in request as formerly, the railways buying the cheaper fir sleepers in preference. Prices of other kinds of fir timber, such as baulks and battens, were unusually high, and a lively business was done for export.

The trade in oak, which some years ago was allowed to drift away from Dantzig to Stettin, is now reviving here, the facilities for floating wood down to this city being greater than to the Pomeranian port.

In Königsberg also the wood trade was favoured by an increase in industrial activity. Demand for sawn timber of all kinds remained good, and prices went up accordingly. The sawmills were well employed during the whole year, more particularly as the building activity was so great; the millowners went early, in contrast with former years, to Russia to purchase and secure the necessary lots as soon as possible, which induced the Russian owners to raise their prices by about 15 per cent. The tendency for hewn timber was firm during the whole year. The demand for fir sleepers worked for the British market remained active, and got still better in autumn. The stocks were, therefore, mostly cleared. Also on this sort of wood the Russian sellers had the larger profit, because as soon as the market showed a firmer tendency the new purchases commenced very early, and prices hereon were raised according to the smart demand. The trade in oak sleepers was again lifeless. Oak woods, planchettes, &c., which are sawn chiefly for export to France, only met with unsatisfactory prices. For this kind Königsberg gets every year less important, as the prices of purchase are too dear against the competition of Galicia. Beech and ash woods were shipped a little more than in the preceding year with profit. Also oak mining timber, which is imported from Russia, met with good demand for Rhenish Westphalian mining districts. It seems that this article will gain in time some importance for Königsberg. Business in fir mining-timber showed a firmer tendency than in the last year, whereas the demand for birch and alder props for England was exceedingly slack. The few sales that were closed brought the usual complaints of bad measure and quality from the buyers, causing losses to the sellers.

The Vice-Consul at Memel reports that upon the whole the results of last year's business in timber can be looked upon with satisfaction. Nearly every article yielded more or less

profit, and the demand was brisk during the whole year. With exception of round timber, the supplies were larger than in the year preceding, and for the most part were sold already in spring. Generally prices have risen so that a reduction is to be expected. Of round timber the supplies did not suffice, and all the saw mills did not find full occupation. Owing to competition prices rose in autumn considerably. Business in sawn wood was very lively. Owing to the mild winter, shipments commenced very early, and were favoured during the whole summer by fine dry weather. The profits made, however, did not correspond with the whole situation of the business. The old stocks of former years were cleared off early, and did not take part in the increase of prices which took place in February, whilst the raw material experienced a rise which stood in no proportion to the prices paid for sawn wood. The new supplies of round timber did not suffice for the demand of our dealers, and therefore some mills did not find sufficient occupation.

SWEDISH GRANITE.

FROM the Norwegian frontier as far as the Gullmar Fjord there is an almost uninterrupted stretch of splendid granite. Its breadth averages about 3 miles, and all along the coast are good and safe harbours or anchorages where vessels may load under almost any circumstances, and as a rule without hindrance from ice in winter. Southward near Warberg and Halmstad, and farther on in the neighbourhood of Carlshamn and Carlsrona are fields of granite of noteworthy extent.

Quarrying has been carried on for many years though not on such a scale as of late. Germany and Denmark used to be the chief consumers, but since the industry has developed to one of importance, other markets have been found, and even from across the Atlantic orders have come in.

There is not very much polished granite exported or used within the country, the main production being supplied to buyers in a semi-rough state, and by them receiving the finish required. The granite of the different districts is suitable for all purposes, architectural and ornamental work as well as for purposes of street paving, dock and quay work. For strength and wear there is no kind to surpass that from the Lysekil district. The colours from the different districts are of great variety and beauty. There are excellent opportunities to British importers to obtain raw material at moderate price since vessels

carrying coal, salt, iron or coke out are always willing to accept a reasonable rate of freight home.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

23338. Walter Darby and Ion Darby, for "Improvements in or relating to circulating water-heaters for greenhouses or other purposes."

23361. William Phillips Thompson, for "Improvements in and relating to gas-engines."

23403. Vincent Hughes and Edward Donald Nicholson, for "Improvements in kilns for burning limestone and other materials."

23489. Chaimsonovitz Prosper Elieson, for "Improvements in electric storage cells."

23492. Augustin Spicer, for "Improvements in burglar alarms."

23554. Louis Emile Prat, for "Improved means for inducing draught in boiler furnaces, fireplaces and the like."

23564. Charles Philip Horton, for "Improvements in preventing sediment or mud-forming incrustation in the lower part of pendant tubes of steam or hot-water boilers."

23569. John Mackenzie, for "Improvements in the construction of windows."

23598. Henry Harris Lake, for "Improvements in scaffolding or staging for the use of builders, painters, decorators and the like."

23757. Silva Liegeois, for "Rotary motor."

22970. England, for "Reversible sliding windows."

24739. Mackie, for "Sliding sash window-frames."

27784. Steed, junior, for "Cistern and like ball-taps."

20858. Paver, for "Window sash-fasteners."

21112. Weisenberg & Herweg, for "Coupling for railway carriages and the like."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{3}{16}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

BELPER.—May 1, 1898.—The Belper Urban District Council offer premiums of 50 guineas and 25 guineas for the two best schemes of sewage disposal. Mr. Joseph Pym, Urban District Council Offices, Belper.

BOOTLE.—Dec. 31.—The Corporation invite competitive designs of a central fire station, firemen's dwellings and district police station. Mr. J. A. Crowther, borough engineer, Bootle.

BYFLEET.—Nov. 13.—The committee of the proposed village hall for Byfleet invite competitive plans for a village hall and working-men's club, to be erected at a cost not exceeding 1,500l. A premium of 25 guineas will be awarded. Mr. F. C. Stoop, hon. sec., Albany House, Byfleet, Surrey.

CARDIFF.—Dec. 4.—The Corporation offer premiums of 500l., 300l. and 200l. respectively for the three best designs for a new town hall, law courts, &c. Mr. W. Harpur, Town Hall, Cardiff.

DORKING.—Dec. 15.—Competitive designs and plan, with descriptive report thereon and approximate estimates, are invited for erection of infirmary upon workhouse grounds. Mr. George Scales, 35 High Street, Dorking.

SOMERSET.—Nov. 30.—The Council invite competitive plans for large hall, with cloakrooms and retiring-rooms over

present post office, market house and fire-engine house communicating with the town hall, and for conversion of market house, &c., on ground-floor. Premiums of 25l., 15l. and 10l. will be awarded. Mr. Regd. L. Foster, town clerk, 1 Cathedral Green, Wells.

SOUTHEND-ON-SEA.—Nov. 20.—Plans invited for new church. Rev. E. E. Kimber, St. Albans, Avenue Terrace, Southend-on-Sea.

CONTRACTS OPEN.

ACTON.—Nov. 16.—For erection of a fire-engine station in the High Street. Mr. D. J. Ebbetts, surveyor, 242 High Street, Acton.

ALNWICK.—Nov. 10.—For erection of a cart-shed in the Brewery Yard. Mr. Geo. Dunn, secretary, The Brewery, Dispensary Street, Alnwick.

BIRMINGHAM.—Nov. 9.—For erection of porches, dwarf wall, &c., and adapting the engineer's house into a porter's lodge at the workhouse, Sleaford. Mr. Edwin Docker, clerk.

BLACKBURN.—Nov. 10.—For alteration of shop premises in Sarah Ellen Street. Messrs. Simpson & Duckworth, architects, Richmond Chambers.

BROADWAY.—Nov. 8.—For erection of a stone fire-engine station. Mr. John Morris, clerk, The Green, Broadway.

CHRISTCHURCH.—Nov. 13.—For erection of a ward at workhouse, Fairmile Road. Mr. E. H. Burton, architect, Bournemouth.

CARLISLE.—Nov. 12.—For building two houses. Mr. Geo. Armstrong, architect, 75 Lowther Street, Carlisle.

CORK.—For iron roofing and other work at premises, Knapp's Square. Mr. Arthur Hill, architect, Cork.

CORK.—For erection of two semi-detached villas on the Douglas Road. Mr. D. J. Buckley, architect, 21 Adelaide Street, Cork.

FENWICK.—Nov. 16.—For alteration and repairs at old Wesleyan chapel, and its conversion into a parish room. Mr. Thos. Latham, chairman of parish meeting.

GEDNEY.—Nov. 11.—For erection of an infants' school at Gedney Drove End. Mr. William Jarvis, architect, King's Lynn.

GOLBORNE.—Nov. 10.—For beautifying Baptist chapel. Mr. Roger Yates, High Street, Golborne.

GREAT YARMOUTH.—For alterations and additions to the rectory and outbuildings, barn and stables, at Mautby. The Rev. J. N. Dredge, Mautby.

GREENWICH.—Nov. 10.—For erecting a dwarf wall and iron fencing in portions of South Street and Greenwich Road, Greenwich, and for other works in connection therewith. Mr. J. Sempcer, clerk.

HAILSHAM.—Nov. 9.—For erection of the central part of an isolation hospital, near workhouse. Mr. Edmund Catt, jun., Church Street, Willington, Eastbourne.

HALIFAX.—Nov. 12.—For erection of an engineers' tool-shop in Union Street South. Mr. Arthur George Dalzell, architect, 15 Commercial Street, Halifax.

HAMPTON COURT.—Nov. 15.—For pulling down part of a chapel and reconstructing same for coachhouse, stabling, &c. Mr. Harry Tagg, Thames Hotel, Hampton Court Bridge.

HAWES.—Nov. 13.—For erection of market hall. Mr. J. F. Kay, architect, 34 Prudential Buildings, Park Row, Leeds.

HOMERTON.—Nov. 10.—For altering and repairing the houses 26 to 60 (inclusive), Sidney Road. Mr. Frank R. Coles, clerk, Homerton, N.E.

HORNSEY.—Nov. 15.—For erection of buildings for a central library. Mr. E. J. Lovegrove, surveyor, Southwood Lane, Highgate, N.

BERRY, CAMPBELL & CO.

WARMING & VENTILATING ENGINEERS,

62 WATLING STREET, QUEEN VICTORIA STREET.

Heating by Hot Water, or High or Low Pressure Steam, expeditiously carried out on the most approved principles. Special attention given to Private Residences.

ESTIMATES FREE.

ILKLEY.—Nov. 9.—For erection of three houses at Skipton Road. Mr. Rhodes Calvert, architect, 4 Forster Square, Bradford.

IPSWICH.—Nov. 8.—For alterations and additions to the Boys' Middle School. Mr. J. S. Corder, architect, Wimbourne House, Ipswich.

IRELAND.—Nov. 25.—For erection of two one-storey cottages at Ballyhaise Station, for the Great Northern Railway Company (Ireland). Mr. T. Morrison, secretary, Amiens Street Terminus, Dublin.

KEIGHLEY.—Nov. 10.—For erection of store in Lawkholme Lane. Mr. John Haggas, architect, North Street, Keighley.

KESWICK.—For 122 yards of stone wall, 4½ feet high, including rough top. Red House, Keswick.

LANCASTER.—Nov. 15.—For alterations and additions to the girls' school, Middle Street. Messrs. Austin & Paley, architects, Lancaster.

LANCASTER.—Nov. 13.—For erection of boundary wall to Springfield Park in Ashton Road. Mr. T. Cann Hughes, town clerk, Town Hall, Lancaster.

LEEDS.—Nov. 12.—For erection of twelve houses and two shops at Whitecote, Bramley. Mr. J. P. Kay, architect, 34 Prudential Buildings, Park Row, Leeds.

LEEDS.—Nov. 18.—For heating infectious diseases hospital. City Engineer, Municipal Buildings, Leeds.

LEWISHAM.—Nov. 23.—For erection of a coroner's court and mortuaries in the Ladywell Road. Surveyor, Lewisham Town Hall, Catford, S.E.

LYNTON.—Nov. 15.—For erection of a cottage residence at New Mill. Mr. G. C. Smyth-Richards, surveyor, Barnstaple.

MARLBOROUGH.—Nov. 11.—For erection of county police-station. Mr. Charles S. Adye, county surveyor, County Offices, Trowbridge.

MARYPORT.—Nov. 9.—For enlargement and alterations at the Glasson Board schools. Mr. C. Eaglesfield, architect, Maryport.

NEATH.—Nov. 15.—For erection of the Smith's Arms Hotel, Neath Abbey. Mr. J. Cook Rees, architect, St. Thomas's Chambers, Church Place, Neath.

OSSETT.—Nov. 11.—For erection of a shop and warehouse. Messrs. John Kirk & Sons, architects and surveyors, Dewsbury.

PLYMOUTH.—Nov. 15.—For erection of poultry, fruit, vegetable and fish market. Messrs. King & Lister, architects, 8 Princess Square, Plymouth.

PONTEFRAC.—Dec. 4.—For erection of an infectious disease hospital. Messrs. Tennant & Bagley, architects Pontefract.

POPLAR.—Nov. 11.—For works at Poplar baths and wash-houses, East India Dock Road. Messrs. Clarkson, architects, 136 High Street, Poplar, E.

RAVENSTHORPE.—Nov. 10.—For pulling-down the cottages and wall at Fir Cottage, and building a new wall. Mr. Thomas Hemingway, Council Offices, Ravensthorpe.

ROCHDALE.—For erection of minister's house at Castlemere. Mr. T. Townend, jun., architect, District Bank Chambers, Rochdale.

SHEFFIELD.—Nov. 9.—For erection of stables, loose-boxes, cartsheds, foremen's houses, offices, boundary wall, &c. on a site between Charlotte Road and the Olive Grove Football Ground. Mr. Charles F. Wike, surveyor, Town Hall, Sheffield.

SOUTHBOROUGH.—Nov. 11.—For erection of a meter and governor house at the new gasworks, on the Liptraps Park Estate, High Brooms. Mr. Corbet Woodall, Palace Chambers, Bridge Street, Westminster, S.W.

STOCKBRIDGE.—Nov. 9.—For construction of a dwarf concrete wall, about 200 yards in length, near the Wagon and Horses Inn. Mr. W. J. Ayles, district surveyor, Broughton, Stockbridge.

STOCKWELL.—Nov. 18.—For reconstruction of certain flues and chimneys at the South-Western Hospital, Landor Road. Mr. T. W. Aldwinckle, architect, 1 Victoria Street, Westminster.

STOKE-UPON-TRENT.—Nov. 10.—For alterations at the workhouse. Mr. C. Lynam, architect, Stoke-upon-Trent.

STONEHAVEN.—Nov. 8.—For proposed Corporation lodging-house. Messrs. J. & J. A. Souttar, architects, 42 Union Street, Aberdeen.

SWINDON.—Nov. 13.—For erection of two pairs of semi-detached villas in Springfield Road. Mr. W. H. Read, architect and surveyor, Corn Exchange, Swindon.

THORNE.—Nov. 19.—For renovation of Thorne Wesleyan chapel. Mr. J. Wills, Derby.

TORQUAY.—Nov. 8.—For erection of buildings, construction of approach road, &c., on the site of refuse destructor, Upton. Mr. Henry A. Garrett, engineer, Town Hall, Torquay.

TRADE NOTES.

THE new hospital, Bridport, is being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues.

THE Horsfall Furnace Syndicate, Limited, have been awarded, at the Brussels International Exhibition, a gold medal for patent refuse destructors, and a bronze medal for a patent smoke-consuming boiler furnace.

MESSRS. WILLIAM JOHNSON & SONS, Castleton Foundry, Armley, Leeds, have recently obtained from Messrs. F. L. Smidth & Co., of Copenhagen, the sole right in the British Isles for the manufacture of their patent tube mill, which has made such a revolution in the cement trade during the last two years. We understand the firm will be ready for placing these on the market by the new year.

THE November issue of *Advertising* is just to hand. It contains valuable information for all business men; advice as to when, where and how to advertise to the best advantage; articles that inspire the large man to do greater things, and the small man to achieve big things; in fact, it is a most encouraging and helpful journal to enterprising men. The subscription is 2s. 6d. per annum, post free. A sample copy will be sent free on application to J. H. Osborne, *Advertising*, 132 Fleet Street, London, E.C., if billhead or business card is enclosed.

A SYNDICATE is being formed in Dundee for the development of Annan's newly-invented anti-accident apparatus for the cleaning of windows from the inside. It is claimed for this invention that it is the simplest, cheapest and most effective appliance ever invented, that it requires no alterations on woodwork of existing or new windows, and, being detachable, one set of apparatus does for all the windows of a house. If all these claims are successfully vindicated in practical use, we shall no doubt hear more of the appliance before long.

BUILDING AND BUILDERS.

It has been decided to build a new chapel at Reddish at an estimated cost of about 550*l*.

THE ratepayers of Willesborough (Kent) have decided to provide a public water-supply for the town at an estimated cost of 10,000*l*.

THE foundation-stone of the Convalescent Home of the East London Hospital for Children at Bognor was laid on the 28th ult. by the chairman of the board of management, Mr. H. W. Trinder. The building about to be erected will contain twenty-eight beds for convalescents, besides accommodation for the hospital staff and nurses and a playground for children.

IT is stated that after carefully surveying the ground during the past summer the London and North-Western Railway Company has decided to construct a tunnel through Shap Fells, the surmounting of which is the greatest obstacle to rapid transit between England and Scotland on this route. The tunnel, which will be about ten miles long, by far the longest in England, will start a little north of Tebay and emerge about Clifton.

AMONG the improvements shortly to be taken in hand by the naval authorities at Portsmouth is the construction of a swing bridge connecting the gunnery establishment at Whale Island with the mainland. At present the existing roadway is only passable at low water, and consequently much inconvenience arises. When the Lords of the Admiralty were at Portsmouth, the need for the alteration was pointed out to them, and their lordships concurred that the improvement was necessary. A sum of about 5,000*l*. will be provided for in the next naval estimates. The authorities have also in contemplation the construction of a road to connect Horsey Island with the mainland near Hilsea. This will involve a very much heavier expenditure than in the case of Whale Island, but it is stated the work will be commenced next summer.

THE third annual meeting of the Scottish Building Trades Federation was held on the 28th ult., in the Building Trades-Exchange, Glasgow, Mr. John Adam, builder, Glasgow, president, in the chair. A large number of representatives were present from all parts of the country. The report of the executive was submitted, from which it appeared that there were now thirty-two branches affiliated, embracing nearly all the principal towns throughout Scotland. On the motion of the chairman the report on the financial statement was adopted. The executive and office-bearers were elected for the ensuing year:—Mr. John S. Hay, builder, Dundee, president; Mr. James Leslie, builder, Aberdeen, and Mr. Thomas Kay, wright, Glasgow, vice-presidents, with an executive of thirty-six members. Mr. James L. Selkirk, C.A., was re-elected secretary and treasurer. Various important matters bearing on the

progress of the federation were considered, including draft general conditions of contract, all of which were fully discussed, and some of which were remitted to the executive to carry out.

THE memorial-stone of the new Central Higher Grade School, which is being erected in Whitworth Street, Manchester, was laid on Tuesday last. The new school, the cost of which will be about 50,000*l.*, will consist of a basement, rising above the street level, and containing ample accommodation for the teaching of laundry and cookery work in connection with the day and evening departments. Separate dining-rooms are to be provided for boys and girls; there is to be a spacious gymnasium, and (at the rear) a large room for manual instruction in woodwork. On the ground-floor there will be accommodation for girls and on the floor above classrooms for boys. At the top of the building physical and chemical laboratories will be placed. In addition special accommodation will be provided for pupil teachers. Altogether the new building will accommodate over 1,400 scholars, and will almost adjoin the City Technical Schools, now in course of erection at an outlay of over 150,000*l.*

ELECTRIC NOTES.

MR. F. J. WARDEN-STEVENS, A.M.I.E.E., of Westminster, who was recently appointed the consulting engineer to the Dorking Council in connection with the electric lighting, has now completed his report on the scheme for supplying the district. The report which he was lately appointed to prepare for the Lewes Corporation on the lighting of the borough by electricity has been discussed in committee, and the Corporation have decided to act upon it and apply for a provisional order under the Electric Lighting Acts of 1882 and 1888.

OWING to a fire caused by the fusion of the wires at the Bolton Electricity Works on Tuesday evening, Bolton, so far as the electric lighting was concerned, was placed in darkness, the whole supply being cut off. The result proved very inconvenient, the streets, public buildings, hotels, tradesmen's establishments and the clubs being practically unlighted. No serious damage resulted from the fire, but considerable confusion was caused in the town.

THE highways and buildings committee of the Aston District Council report that they have retained the services of Mr. Vaudrey, electrical expert, to advise them in regard to this matter; that, acting in accordance with the regulations of the Board of Trade, which require the Council to select and

advertise the streets or roads they propose to electrically light within the next two years, an inspection of the district has been made, and the streets or roads they have selected to electrically light are as follows:—Aston Road, Lichfield Road, High Street, Birchfield Road, Lozells Road and Victoria Road.

THE ceremony of turning on the electric light in Cambuslang was performed on Friday last by Mr. A. Lindsay Miller, chairman of Cambuslang Gas Company. The installation was fitted up by Messrs. Hunter & Jack, Glasgow, and the power is supplied from Cambuslang Gasworks. The engine is 29½ horse-power, and is driven at a speed of 250 revolutions per minute, the dynamo being capable of giving 1,100 volts, but it will only be run at present to give 700 volts, which will be sufficient for the lamps erected in the main street. There was a great concourse of people in the streets, and the brilliancy of the lamps was much admired.

VARIETIES.

MR. FRANCIS WILLIAM BEDFORD, architect, has taken into partnership Mr. Sydney D. Kitson, M.A. The practice will be carried on under the style of Bedford & Kitson, at 12 East Parade, Leeds, and 8 Prince's Street, Westminster, S.W.

AT the monthly meeting of the Leeds Association of Engineers, the president (Mr. William Sheldon) in the chair, Mr. Alfred Towler, M.I.M.E., read a paper on "The Economic Development of the Steam Engine."

THE formal opening of the new Constitutional Club at Coalville took place on the 28th ult. The building, the foundation-stones of which were laid in January last, has a frontage to the High Street of the town of 50 feet. The cost has been about 2,200*l.*

THERE has been placed in the chancel of St. Philip's Church, Dorridge, a new communion table of oak. This has been purchased with the offertory on Jubilee Sunday. The sides of the table are inscribed:—"To the Glory of God" and "1837 V.R.I. 1897."

VAULTS are being prepared beneath the Roman Catholic Cathedral, now in course of construction in Westminster, for the reception of the bodies of Cardinal Wiseman and Cardinal Manning, which lie at present in St. Mary's Cemetery, Kensal Green. It is probable that all future cardinal archbishops of Westminster will also be interred in the cathedral.

PRICE LIST AND ESTIMATES ON APPLICATION.

A SERIOUS affair has occurred in Partick, resulting in the partial flooding of the Glasgow district subway, and subjecting the city and suburbs to a water famine. The large main pipe which supplies Glasgow with its water burst in Dumbarton Road, Partick, with the result that the subway was flooded to the depth of several feet. The watermen were at once telephoned for and the supply cut off, the consequence being that the entire population of Partick, numbering 47,000, was left without water. The traffic in the subway was continued on Saturday, but the cars had to pass through about 3 feet of water in certain parts of the line.

THE Tivoli Restaurant, Strand, which for the last four or five years has been standing idle, having been acquired by a powerful syndicate, was placed in the capable hands of Mr. Ernest Rüntz, who has practically reconstructed it and converted it into a thoroughly first-class and up-to-date restaurant, which deserves well of the public. When we say that the decorations and furnishings are by Warings, Limited, Oxford Street, while the cares of the *cuisine* devolve upon M. Aubunel, of Monte Carlo fame, and that a capable orchestra is retained, our readers will understand that it is a place wherein to obtain a *recherché* meal with bright and elegant surroundings.

AT New Pellon, Halifax, the Liberal Club of the western division of Ovendon Ward have opened their new premises. The building is of a rather plain character, and the outer walls are of brick. On the ground floor is the billiard-room, allowing space for two tables, and on the first floor is the reading or assembly-room, furnishing accommodation for 400 persons. The total cost will be about 600*l*. The plans have been prepared by Mr. Medley Hall, architect, Northgate, Halifax.

RECENT excavations in the north upper transept of Lincoln Cathedral have brought to light, about 8 inches below the pavement, the north-east angle of a Norman chapel, or part of the north arm of Remigius's Cathedral. The axe marks on the ashlar-work and plinth are as fresh as when buried over 600 years ago. In the north end is the east jamb of a Norman recessed door, of two orders of bases. Further excavations are awaited with interest; if carried out the remaining jamb of the door would probably be brought to light or the position of the transept of the Norman cathedral fixed.

THE new drill hall of the Barnsley volunteers at Eastgate, which has been completed nearly twelve months, has been formally opened by Colonel Stanhope, C.B. The premises have been built at a cost of more than 4,000*l*. They comprise on the street level a drill hall 85 feet by 45 feet, with a drill shed of

similar dimensions beneath it. An armoury, smoke-room, officers'-rooms, clothing-rooms, caretaker's premises, &c., are also provided.

GLASGOW BUILDING EXCHANGE.

THE annual meeting of the members of the Glasgow Building Exchange was held on October 29. Sir William Arrol presided. The report, which was submitted by the secretary, Mr. David Cook, showed that for the year ending September 30 the income amounted to 850*l*. 6*s*. 10*d*., and the expenditure to 668*l*. 8*s*. 7*d*., giving a credit balance on the year's working of 181*l*. 18*s*. 3*d*. Of this balance the executive have devoted a sum of 5*l*. 3*s*. 7*d*. to depreciation on furniture, being 5 per cent. on the total original cost, and a sum of 31*l*. 17*s*. 6*d*. to writing off 10 per cent. of the preliminary expenditure in connection with the formation of the company. These sums, amounting together to 37*l*. 1*s*. 1*d*., being deducted from the year's credit balance, leave a sum of 144*l*. 17*s*. 2*d*. to be carried to the credit of the exchange. This is a satisfactory state of matters, and sets at rest all fears as to the financial carrying on of the exchange. The executive have accordingly resolved to recommend that at this time a dividend of 5 per cent. be declared on paid-up capital. The membership continues to keep up, but with a little effort it could be substantially increased. "In connection with the November municipal election," the report goes on to say, "recognising the importance to the building trades of securing the return of reliable representatives, they in conjunction with the Landlords' Association framed certain questions which they had put to the candidates at the various election meetings in order to bring their views fully before the electors. Again, in view of the recognised fact that the by-laws under the Glasgow Building Regulations Act, 1892, are in many cases ambiguous and harassing, the executive, first by deputation and again by memorial, approached the Corporation with a view to obtaining a revision of these by-laws, and although they were not immediately successful they believed that they succeeded in bringing forcibly under the Corporation's notice the more glaring defects in the regulations, and that their efforts will not be without effect in the near future. The executive have pleasure in advertising to the fact that Edinburgh has followed Glasgow's example and inaugurated a building exchange on lines precisely similar to our own. Other cities have also indicated an inclination to follow our example, and it is not improbable that before very

long we shall have a building trades exchange in every city of any importance in Scotland. Should this come about, and reciprocal rights be introduced whereby any member of a building trades exchange would be entitled to make use of the exchange in any other city which he happened to be visiting, it would be an additional inducement to join such bodies. In conclusion, while satisfied with the progress that the exchange is making, the executive cannot but express their disappointment that greater advantage is not taken of the advantages it offers. They would especially desire to see a larger daily attendance of members at the exchange hour, which is from twelve till two. It is only by occasional attendance at the exchange and keeping in touch with its workings that individual members will begin to take an interest in all connected with the association, and the executive trust that during the current year there will be a marked advance in this direction." The report was adopted on the motion of the chairman, seconded by Mr. John Paterson. A vote of thanks to the chairman brought the proceedings to a close.

RIVAL BUILDING OPERATIONS AT SEAFORD.

THE case Hutchings v. the Seaford Bay Estate Company, Limited, has been heard before Mr. Justice Stirling. It was a motion on behalf of the plaintiff to restrain the defendants and their contractors till the trial or further order from working and getting chalk from the plaintiff's property, known as Sutton-cum-Seaford, so as to obstruct a cart-road constructed at the eastern boundary of his property.

It appears that at the end of last year or the beginning of this, plaintiff purchased a building estate of 830 acres at Seaford, adjoining the sea, and he found that there was in existence an agreement entered into in 1881 under which the predecessors in title of the Seaford Bay Company became entitled, subject to certain limitations, to take chalk out of the land so purchased upon the terms that they should construct a sea wall and parade along the whole frontage of the plaintiff's as well as the defendants' land. The sea wall was finished in 1892, and the work altogether, according to the plaintiff's view, came to an end in 1895. On May 7, 1897, he gave, as he was entitled to do, notice to the defendants to terminate the license to take chalk at the end of the year, and he discovered in September that Mr. Young, a contractor with the Seaford Bay Company, had laid down a line of 3-feet 6-inch gauge, and was working a

locomotive for the purpose of taking chalk, that a siding had been made upon his land, and that a road necessary for his building operations had been rendered impassable.

For the defendants it was denied that any right of the plaintiff had been infringed, or that any possible injury could be done to him by the contractor's mode of working. A portion of the sea wall had not yet been raised to the full height, and what the defendants were doing was in accordance with the original plans in the agreement of 1881. The plaintiff having given notice to terminate the license to take chalk from his land, a locomotive railway was the only means by which the quantity required could be raised in the time. The approach which the plaintiff complained was obstructed was not of the slightest use to him, was made by a person named Green, and, in fact, had never been used by any one for some time past, but the defendants had offered to make for him, if he desired it, a passage for his carts over the tramway.

Plaintiff conceded that the road was first constructed by Green, but it was completed by the plaintiff, and was necessary for other development of his property. He might not be entitled at that stage to make the defendants take up the rails, but if he was right in his contention that they ought not to have been laid down he was entitled to prevent the running of a locomotive upon them, and also to restrain the defendants from continuing a state of things by which a roadway of his was obstructed.

Mr. Justice Stirling said that the defendants were willing to undertake to put the road right, but there was still the question of whether what the defendants were doing was within the terms of the agreement of May 31, 1881, as to whether the approval of the plaintiff's agent was required. That depended whether the words "working or getting" included removal. In his opinion they did; that therefore the approval of the plaintiff or his agent was necessary to the means adopted by the defendants for the removal of the chalk. Certainly no approval had been given to the use of the locomotive, and he must restrain the use of it. The plaintiff was, however, of course, under an obligation to approve of a reasonable method of removal. The order would be that upon the defendants undertaking forthwith to restore the road and divert the line of rails so far as necessary, no order would be made upon the first part of the motion, but there would be an injunction until the trial of the action, or further order, restraining them from removing the chalk by any method not approved of by the plaintiff or his agent.

"OWEN STONE."

WORPLESDON, Surrey, is the picturesque *locale* selected by the Owen Stone Company as the scene of their operations. Here they have acquired an extensive acreage of land, have erected commodious works and laid down complete and even elaborate plant, and are about to put up a substantial stone-built village for the accommodation of some 300 workmen and their families, all of which bear evidence to the complete confidence felt by the company in their future prospects, and the confidence is warranted by the excellence of the stone produced by their patent process.

"Owen stone" is a building material produced by a combination of siliceous sand and hydraulic lime in the proportions of $77\frac{1}{2}$ per cent. and $12\frac{1}{2}$ per cent. respectively. These substances are caused, under a pressure of 60 lbs. to the inch in the presence of highly heated water, to chemically combine, thus forming a hard, homogeneous and beautiful stone of excellent colour and fine texture.

The stone is made in steel moulds, which can be adjusted to any size, shape or design for which the finished stone may be required, and the process is of such a character that the most delicate designs or mouldings can be readily produced in blocks or pieces up to 10 tons in weight. The economy resulting from the manufacture of the stone in the form or shape for which it is ultimately required is of vast importance, saving, as it does, the labour of working the stone at the building and the transport of unnecessary weight.

A most important feature of this material is that it can be used immediately after removal from the moulds, without having to be kept for several months to harden. Another

very important feature is that "Owen stone" can be carved, turned, worked, coped, &c., with as much ease and facility as the very best Portland stone.

The company have made a fortunate selection of land for their purpose, as the piece on which their works are situated has an area of 20 acres, the soil of which to a depth of at least 120 feet is composed of clean, white, sharp sand, exactly suited to the manufacture of the Owen stone. They have had a siding to the South-Western Railway constructed and have a plentiful supply of water.

The stone has been subjected to severe tests of every description and has in each case completely vindicated its character as a building stone of excellent quality; and, which is of prime importance, it can be put on the market at a price which should bring it into pretty general use.

The offices of the company are at 28 Basinghall Street, E.C., where numerous samples of the stone may be inspected.

INSTITUTION OF CIVIL ENGINEERS.

ON Tuesday the opening meeting of the seventy-ninth session of the Institution of Civil Engineers was held. Sir John Wolfe Barry, the president, delivered the inaugural address.

The President, at the commencement of the proceedings, said he was requested by the unanimous vote of the Council to submit for the acceptance of the meeting a resolution of condolence with His Highness the Duke of Teck and family in connection with the lamented death of the Duchess of Teck. He felt certain that resolution would commend itself to the feeling of those present, and that the institution, as a body, would feel particularly that some message of sympathy was due to the Duke of Teck, who had always taken a great interest in the institution and was frequently a guest at their annual dinners. The resolution was as follows:—"The President, Council and members desire to place on record their profound sympathy with His Highness the Duke of Teck and family on the occasion of the death of Her Royal Highness Princess Mary of Cambridge, Duchess of Teck—a Princess universally loved, whose life was devoted to good works, and whose memory will be cherished for generations to come in the hearts of the people."

The motion was agreed to in silence, the members standing during the President's remarks.

SANITARY CONGRESS, LEEDS, SEPTEMBER, 1897.

THE HIGHEST HONOUR. SILVER MEDAL AWARDED.

THE "FRYSTON"

SIMPLEX OR DUPLEX FIRE. SUCCESS IN COOKING GUARANTEED.

Made in all types, either Leamington, as shown, or Yorkshire type, with high and low oven, from 4 ft. 3 in. wide by 4 ft. 6 in. high, to almost any size, or of the Restaurant and Hotel class, with any number of ovens.

Also made in small sizes with one oven, and with either side or back boiler, from 3 ft. 6 in. upwards, with one oven and either back boiler and hot hearth with rings and plug, or side boiler.

BY FAR THE MOST EFFECTIVE KITCHENER IN THE MARKET.

PATENTEES AND MANUFACTURERS—

THE FERRYBRIDGE FOUNDRY COY.
FERRYBRIDGE, YORKS.

The President, after thanking the members for his election to a second year of office, entered upon a discussion of what he termed domestic affairs, as not only touching the *domum* or home of the institution, but also embracing matters which might affect the members either as a body or individually. With regard to the elections to the Council, he pointed out that the main burden of government, and the ultimate decision on important matters, devolved upon those members who were resident in London or its neighbourhood, and could consequently be assembled frequently at the Council table, and expressed the opinion that the system of local representation should not be carried too far. The ordinary work of the Council grew, and must further increase with the numbers and importance of the institution, now numbering 7,075 members, associate members, associates and students on its roll, and recent important changes in the work of the institution, and the construction of their new building, had rendered the labours of the council during the past two or three years peculiarly heavy. It was, he thought, a matter for satisfaction that the institution had recently undertaken functions of great utility which might formerly have been considered as outside their sphere of duty. He alluded to such matters as the determination of standards of the thermal efficiency of steam-engines, a committee on which subject, consisting of ten thoroughly representative persons, under the presidency of Dr. Kennedy, was nominated by the Council in 1895 under the auspices of his predecessor, Sir Benjamin Baker; and again to the consideration of the best method of tabulating engine and boiler trials, upon which an equally efficient committee, of which Sir William Anderson was chairman, was appointed by the Council this year. In connection with the subject of the widely-spread interests of engineering, he expressed his individual opinion that it was for the good of the institution and of the profession that the class of associates—not entitled to the privileges of corporate membership—should be carefully encouraged and developed. Dealing with matters which had occurred during his term of office, he said a new departure was made in the inauguration this year of their engineering conference in London, which occupied three days, and in respect of which a great success was achieved. The result of the whole experience indicated that they were right in thinking that those resident out of London would welcome the opportunity of making a more intimate personal acquaintance with their metropolitan brethren, and that the latter would highly prize the opportunity of meeting the engineers from other parts of

the kingdom. The numbers attending the meetings were approximately half from London and half from other places. Another important matter which had occupied much of their attention was that of the examinations for admission to the class of associate member, the first of which examinations had now already taken place. As in the conference, so in the matter of the examination syllabus, they were brought face to face with the many-sided aspects of their profession. And accordingly the regulations had been so made that, while ensuring that each candidate should satisfy the examiners on matters of general principles of science, which must always be and were recognised as the bases of their profession, each person might, so far as the specific application of his scientific knowledge went, qualify in the particular branch of engineering which he had studied or to which he desired to devote himself. Since the by-laws were passed on the subject of examinations 118 entries had been made of candidates for election, and of those eighty-nine were gentlemen who, *primâ facie*, would be classed if elected as associate members. Of this number sixty had been remitted for examination or for the submission of certificates from the various examining bodies which were recognised by the Council. While he was an advocate of examinations for the purpose of insuring that a man possessed the qualification of theoretical knowledge before he was classed as an engineer belonging to them, he did not wish for a moment to be understood as claiming for such knowledge one whit more than it was really worth in the equipment of an engineer for his career. It was one side only, however important that side might be, of their education. Practical knowledge was at least as necessary as theory, and, while advocating the cultivation of the latter, he felt very strongly the immense importance of the former. They did not desire to make their successors mere theorists, but good engineers; and they wanted them, under the pressure of foreign competition, to be in the future, as they had been in the past, second to none in the world. He anticipated that their certificate of a man being a corporate member of that institution would be recognised throughout the world as the highest and most coveted degree in engineering as well as a criterion of social status. With reference to the new building, which might now be said to be completed, and which had cost about 60,000*l.*, he thought it might be said that the structure would be a credit to any public body to which it might belong. It suited their requirements well for the ordinary work of the institution, and by dividing the attendances (some 3,000 in number) at the annual conversazione into two nights, they could entertain members

and friends in a way which, he thought, left little to be desired. For himself, he wished that they had a hall in which they could not only satisfactorily receive all conversazione friends on the same night, but in which they could hold examinations, accommodate examiners, give lectures to students and candidates for associate membership, accommodate congress, and use for purposes extraneous to the present ordinary sessional and day-to-day business without interfering with the other work of the institution. Further, there were even now extraordinary occasions of special interest on which their theatre could not properly accommodate the members in meeting assembled and when a large assembly-hall would be of much use; while, lastly, it would be very satisfactory if they could give their annual dinner in their own home. After the large sums of money recently spent on the new building and its site they could not as an institution contemplate at the present time the expenditure from the funds at their disposal of such an amount as would be necessary for the site for and the erection of a hall of the proportions which he had in his mind, but he threw out the idea for the contemplation of some benevolent millionaire. In connection with such a hall, and as, perhaps, an even more important requirement, might be built a museum, which could readily be placed either over or under the hall without detracting from the utility or appearance of either apartment. At present they had to refuse almost everything that was offered to them in the shape of models and specimens, not for want of appreciation of their value, but because their accommodation in the only room they had—viz. that over the library—was utterly insufficient for any practical purposes as a museum worthy of the name, as illustrative of their work and experience. After alluding to the benevolent fund, which, he said, really merited more support than it received, he urged members, each in their particular branch of work and in their special walk in life, to realise the importance and character of their profession, judged by the responsibilities laid upon it, its past extraordinary progress, its present numbers and the certain future which lay before it. And while they did all in their power now to advance its present best interests and to insure its proper position, let them look ahead and, as far as they could, make provision in every respect for its future life and for its continued prosperity. In conclusion, he said it was a matter of profound pleasure to him to be a member of such a calling as theirs, which was, he knew, the envy of many thoughtful persons of other professions, who sighed for the exactitude attainable in their work, and longed for the pleasure which they, at least, could realise in the con-

templation of work successfully designed and executed, enduring monumentally of them when they themselves had passed away. Feeling as he did on these subjects, they might imagine how highly he valued the honour of being again their President, how grateful he was for such a mark of consideration and trust, and how determined he was to do everything in his power, with the help of the Council and officers, to serve the institution, and to prevent its interests from suffering in the slightest degree during the time given to him in which to work.

The medals awarded for the session 1896-97 were afterwards presented by the President, and a reception was held in the library after the meeting.

A vote of thanks was passed to the President for his address, on the motion of Sir Frederick Bramwell, seconded by Mr. Edward Woods.

THE CENTRAL LONDON RAILWAY.

ON Saturday last some members of the Institution of Junior Engineers visited the works of the Central London Railway. Nearly 100 feet below the level of Tyburn Hill, where it slopes towards a fashionable neighbourhood that disowns that ancient name, says the *Daily News*, huge shields driven by hydraulic rams that work up to a pressure of one ton on every square inch are burrowing silently through the blue clay at the rate of 4 to 6 inches for every working hour of the day. The engines that supply compressed air to these shields are stationary at the corner of Queen's Road, Bayswater, and from these the enormous hydraulic power is controlled. It was for the purpose of inspecting these engines, as well as the progress of tunnelling below ground, that the party visited the Bayswater works of the Central London Railway on Saturday afternoon by permission of Sir Benjamin Baker, its chief engineer, and Mr. John Price, the contractor. Jets of steam from a small funnel sufficed to indicate the locality, but beyond these there was little save the whirr of wheels on a travelling crane and the rattle of chains where a rude cage-lift ascended or descended, to suggest that resistless forces were in operation so far below the surface. One might have stood directly over the spot where a great shield was burrowing its slow way and felt not so much as a tremor of the ground that could have caused him to ask "Art thou there, old mole?" Though it was Saturday afternoon, gangs of navvies were in full work, so that the young

engineers were enabled to see all the details of tunnelling just as it goes on every day of the week. Mr. Mott, who, as resident engineer, is Sir Benjamin Baker's representative, took charge of the party, and either he or members of Mr. Price's staff accompanying each batch of visitors explained to them all that needed explanation. First they were asked to look at the machinery for compressing air and the air-driven hydraulic pump by which all the actions of enormously powerful rams are produced. Except in their force these do not differ greatly from types with which nearly every young engineer must be theoretically, if not practically, familiar. The party then descended the 30-feet shaft by means of a rude cage, seven at a time, each detachment being under the care of one of Mr. Price's staff as a precaution against accident. Knowing what to expect, most of them had wisely arrayed themselves in the roughest garb, which could take no harm from contact with mortar-besmirched timbers, and put on boots that were sufficient protection against the moisture of clay puddle. No water finds its way into these tunnels from the surrounding soil; it is kept by pressure of air at the head of the shield. As that advances, sections of the great iron tube are bolted into their place, and embedded all around in blue lias lime, which, with a mixture of sufficient water to make it find its way into every little crevice, is blown round the outer surface of the iron tunnel by air-pressure. The primary object of this is to prevent any possible settlement, but it also acts as a preservative for the ironwork by excluding all moisture after once the lime has set. Any wetness of the clay through which visitors had to wade when they reached the bottom of the shaft came from the abundance of the water that has to be used in giving fluidity to the lime. Some waste is unavoidable, and as there is no escape for it through the impervious tunnel, it has to mix with the clay of a temporary floor and be there churned into mire by the passing of many feet as workmen go to and fro with the strings of trolleys which, drawn by horses, take away the excavated clay and return empty or laden with heavy sections of the iron arch-ribs.

The main tunnel, giving room for double lines of the ordinary 4 feet 8 inch gauge, will, when finished, have a diameter of 25 feet. A considerable section in this state was seen on Saturday, and at the end of it, boring its way westward, was the great shield, hidden from view by the mass of soil behind it, which gangs of workmen were shovelling into trolleys as the shield advanced under pressure from twenty-two hydraulic rams, each exercising a force equal to one ton on the square

inch. Behind this shield the ground was supported by a hydraulic ram acting on a girdle of massive iron which gives uniform pressure on the working face. As the shield advances this ram moves automatically in sympathy, giving room for a section of the iron tube to be inserted. Every part of each section fits to nicety, being cast in accurate moulds, and all the workmen have to do is to bolt the flanges, which serve as strengthening ribs, firmly together with nuts and screws. After this the lime is blown in under enormous pressure, and the shield begins to creep forward a few inches more. The work is carried on under strong electric light, for which Mr. Rudlestone, engineer of the Electric Traction Company, is responsible. The main tunnel does not by any means represent all the work that is necessary. Giving access to it from the main shaft at each centre of work which represents a future station are subsidiary tunnels, and there are also smaller shafts, 11 feet in diameter, which will eventually serve for ventilation. In addition there are cross tunnels above the crown of the great arch. These will be the passages leading to a central staircase, by means of which travellers will get from the station above ground to the platform. This is to be placed between the up and down lines, giving equal facility of access to either.

At the present rate of progress it is estimated that the Central London Railway between Shepherd's Bush and the Mansion House may be completed in another twelve months, or about two years and a half from the date of its commencement. Necessarily the work carried on at such a depth, and with so many elaborate appliances, will be very costly; but one element of expense is avoided by tunnelling far below the level where sewers or gas-mains might have been met with. The permanent way will be from 50 to 100 feet below the ground surface. In the length of the line there will be altogether thirteen stations, beginning at Shepherd's Bush in the West. Next will be Holland Park, then Notting Hill Gate, and then in succession Queen's Road, Westbourne Park, Marble Arch, Davis Street, Oxford Circus, Tottenham Court Road, British Museum, Chancery Lane, Post Office, and finally the Bank. Works for the station last named are far advanced in the open space that is fronted by the Mansion House, the Royal Exchange and the Bank of England. It will thus be seen that the Central London Railway promises well for residents in the far west of London, who have long wanted a quicker way of getting to the parks and Regent Street, the Law Courts and the heart of the City.

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact it will **Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION.

PNEUMATIC DESPATCH TUBES.

THERE is no doubt that the pneumatic tube has been brought to a degree of perfection that entitles it to rank with the greatest of modern time and labour saving inventions. Tube systems wherever introduced have easily proved themselves prime factors in the conduct and expedition of business in municipal, state, store and office buildings, hotels, banks, newspaper offices, large factories, &c. Wherever it is necessary to transmit orders, messages, mail or cash from office to office,

room to room, floor to floor, or building to building, the tube presents itself as the quickest, most reliable, and by far the cheapest messenger.

A recent issue of the *Inland Architect and News Recorder* of Chicago describes at great length a pneumatic tube plant recently installed in the Illinois Trust and Savings Bank of Chicago, which is said to be the most unique and complete banking building in America. The system delivers leather carriers, $1\frac{1}{8}$ inch in diameter and 9 inches long, to and from every department in the building. All tubes are entirely concealed from view. Carriers travel at a speed of about 30 feet per second and discharge themselves automatically and noiselessly on arrival at their destination. Stoppages are impossible and power is economised to such an extent that its cost becomes too trivial to notice. This system was installed by the Bostedo Pneumatic Tube Company, of New York and Chicago, who claim to be the only company in the world exclusively engaged in all classes of pneumatic tube work. Their managing director for England, Mr. Erbine C. Phillips, 178 Charing Cross Road, shows a collection of photographs of American tube systems that are astonishing as to their size and extent, and says he has won the endorsement of every person and company with whom he has ever done business. His autograph testimonial album certainly contains hundreds of letters from his American patrons in support of his claims.

CENTRAL DESK, BOSTEDO DESPATCH TUBES.

THE Mackelvie Isolation Hospital, Oban, recently opened, is situated on a plot of 4 acres acquired by the Town Council overlooking Glen-shellach, outside the burgh boundary. The site is elevated and dry with a south-eastern exposure. The hospital consists of two one-storey blocks—a ward block and an administrative building, joined by a roofed passage open at the sides. The ward block contains two wards and a nurses' room, each ward having the necessary capacity for four patients. The wards are well lighted and ventilated.

BUILDING CONSTRUCTION AND PUBLIC HEALTH.

AN address was delivered on the 29th ult. by the chief sanitary inspector of Glasgow, Mr. Peter Fyfe, in the Glasgow Building Trades' Exchange, and under the auspices of the Glasgow Master Wrights' Association, on "Building Construction in Relation to the Public Health." Mr. Fyfe said there were two main principles in building construction on which all were agreed (1) that every structure intended to be occupied permanently by human beings ought to be as healthy as it is possible to make it; and (2) that every such structure should, as far as practicable, be able to resist the destructive influence of fire. In considering the subject, he spoke chiefly of those parts more immediately affecting the trade of the carpenter and joiner. A healthy house must firstly be dry in every part; secondly, it must be able to be thoroughly cleansed throughout; and, thirdly, it should leave no facilities within the four walls for the harbouring of infective or other dust. The work of the joiner was greatly influenced by the dryness or the dampness of a building. The Glasgow building regulations dealt with damp or offensive sites, and compelled that such shall be covered with a layer of concrete 6 inches thick, and that the space under the floor of any dwelling-house on or under the street level shall be sufficiently ventilated. All wood was peculiarly susceptible under conditions of dampness, closeness and darkness, unless protected by a metallic antiseptic solution, such as sulphate of copper; and a log which, exposed in the open to the weather would last thirty or forty years, when placed in dark and unventilated places and attacked by living organisms of various kinds would become rapidly a mass of rotteness. Hence the reason for the by-laws referred to. A powerful destroyer of the joiner's work in ground-floors was the absence of a proper and sufficient damp-proof course. This was provided for in by-law 21 of the Glasgow Act. In this connection it had become necessary to discuss the question, What constitutes a damp course of durable material impervious to moisture? Some firms had recently been trying to foist upon builders a felt composition saturated with tar, which they tried to maintain answered the above description. He took a piece of this material from the gable of a building a few years ago. The damp had already pervaded the inside of this gable wall to a distance of 3 feet above the floor. On examining this so-called damp-proof material he found it soaking with moisture and absolutely worthless as a damp course. Nothing

but sheet lead, Caithness flags or rock asphalt, or some such impermeable material should on any account be permitted. To protect the walls and wooden floors where the lowest floor is to be under the surface of the street or ground, by-law 22 provided that "such precautions shall be taken by building double walls or otherwise as effectually to prevent damp from penetrating the wall." This was intended to provide against the rain soaking into the masonry or brickwork at this point, and should be adopted in actual work. In our climate walls exposed to the full force of a southern or western rain became permeated with moisture. He had seen many substantial-looking walls in a saturated condition from this cause, particularly in new buildings. In such cases, and in the case of old walls which damp had entered, the services of the joiner were often employed to disguise the sore and not heal it. This was most objectionable; in fact, just as heinous a sanitary sin as was the hidden unjointed or badly-jointed drain of the mason or plumber. No joiner should obey such an order or perform such a piece of nefarious work. The wetness of such walls should be cured, not covered up. Lulled by the apparent dryness of the wood lining, ignorant tenants took basement or ground-floor houses, little reckoning what it covered, little knowing the abominations (animal and vegetable) which lurked behind—not dreaming that catarrhs, rheums, bronchial affections and respiratory troubles generally—nay, even diphtheria—might be induced by living and sleeping within such wood-lined habitations. He trusted some day that work of this kind would be punishable by law. The Glasgow by-law dealing with floors and flooring provided that "the space between the storeys of each dwelling-house or tenement of dwelling-houses, in other than fireproof buildings, shall be deafened. The deafening boards between the joists may be overlaid with a coating of lime mortar, upon which a layer of clean, dry, riddled engine ashes or other suitable material is spread, and the surface finished and flushed with mortar or a compost of lime, sand and ashes 2 inches thick may be used. All voids between the walls and contiguous joists shall be deafened, and all voids behind skirtings shall be solidly filled with mortar or other suitable material. All partition walls, unless built of brick or stone, shall be deafened." He regretted that the word "may" was used in the fourth line of the by-law instead of the word "shall." What had been the construction of house floors in the past? Under the joists were placed the laths and under them the plaster. On the latter ashes, shavings, chips of wood and other rubbish were laid and the flooring

boards nailed on without any filling up with mortar or lime compost. Very often even the ashes and rubbish were dispensed with. The result of this was that the space between each joist became a receptacle for dust and dirt of every description. From the constant swabbing and washing of floors, to say nothing of occasional accidental floodings with dirty water, it could be imagined in what a condition this huge dust container under floors must be. In even the best kept houses the tenants would be astonished to see what they were dwelling above if necessity occasioned the lifting of the flooring boards. In those houses inhabited by the humbler classes in this city he had witnessed again and again the dreadful mass of festering miscellaneous filth bred and retained by this most insanitary method of floor-making. Such dust contained millions of low organisms inimical to health. Had by-law 27 put an end to this? This was a question he left the meeting to answer. Every flooring board should be nailed down flush upon a thoroughly dry surface of mortar or clean lime compost, and be so tongued and grooved that no filth or dust could find its way to the underside. Then what about the casings around sinks, baths, basins and internal pipes? There was no by-law against the provision of such antiquated dust collectors. The architect and the joiner still combined to provide a quiet nook for the spider in which he could peaceably do his weaving and rear his progeny undisturbed. In those dark places he had neighbours whose presence was not only undesirable, but in many instances absolutely dangerous. Mr. Fyfe further referred to "our old unsatisfactory friend" the sash-window. Here, again, we had a long hollow box for the weights, which in time became a dust chamber, and one peculiarly situated in the direct line of the air-supply to the room. Through the chinks left all round our windows the large proportion of the fresh air to the room enters, and incoming air should not, if practicable, be caused to pass through or over any chambers or hollows where dust and dirt, to say nothing of fungoid growths, were permitted to lodge. A modern fashion had recently come in which he did not think an improvement, viz. the wooden moulding which was carefully nailed round the wall near the ceiling for the purpose of hanging pictures, &c. This formed a very comfortable situation from which myriads of microbes might select their time for pouncing down on the unsuspecting tenant. Dealing next with the roofs of buildings, he said that, from a sanitary point of view, the space between the joists of the top ceiling should be filled up in the same way as the floors underneath. Without

a smooth and level surface it was impossible for anyone to cleanse these places, which, as things were at present, were immense dark stores for dust and atmospheric debris. Coming to cisterns (of which there were comparatively few now in the city), he thought that all should be very carefully covered over and ventilated. He knew one case where the drinking water for the tenement was very peculiarly contaminated. The plumber had gone up to repair the ball-cock when he found that the water of the cistern, which was situated in a dark corner, had been very seriously contaminated by the sweep having just performed his morning's ablution in it. Of course, the sweep could not have done this if there had been a proper air-tight cover on the cistern. Contamination of the water in such cisterns by dead birds, mice and various insects is well known. He further advocated the adoption of the flat instead of the sloped or peaked roof, both on hygienic grounds and grounds of convenience. There would be the undoubted gain of the superficial area for an open space which could be utilised either as a washing green or as a playground. It certainly would be more advantageous to the health of children to play in an atmosphere three or four storeys high than in that which is found at the level of the street or in the back court.

On the motion of the Chairman a vote of thanks was awarded to Mr. Fyfe for his address.

NEW PAVILION FOR EDINBURGH ROYAL INFIRMARY.

THE plans for the new pavilion which it was resolved to erect in connection with the Edinburgh Royal Infirmary, in order to commemorate the Queen's Diamond Jubilee, came before the Dean of Guild Court on the 28th ult., and were passed. The new pavilion is placed at the southern end of the Royal Infirmary grounds, with its longer axis running north and south, immediately to the west of the existing medical pavilions. It thus stands upon the ground purchased some time ago by the managers from the directors of the Sick Children's Hospital. The pavilion resembles in outward appearance the other pavilions, so far as its larger size, and the difference in its internal arrangements rendered necessary in consequence of the special purpose it is to serve, will permit. It consists of a basement (entirely above ground), three floors of wards and an

AGENTS APPOINTED IN ALL LARGE TOWNS.

attic floor. The basement contains a bathing establishment, the want of which has long been felt by the managers of the infirmary. What may be termed the hydropathic treatment of certain diseases has made great progress during recent years, and it was felt to be unworthy of so great an institution as the Infirmary to be entirely without the means of affording the sick the opportunity of benefiting by these discoveries. This reproach will now be removed. The bathing establishment contains a Turkish bath, with three hot rooms, a needle bath, douche baths of various kinds, a vapour bath, and sulphur and other medicated baths. A spacious cooling-room is provided, and there is also ample accommodation in the way of dressing-rooms, hot linen-rooms, attendants'-rooms, lavatories, &c. In the basement, two four-roomed houses for resident officials are also provided. The three floors above the basement contain three wards, specially adapted for the treatment of diseases peculiar to women. At the southern end of the pavilion is situated on each floor a large ward of twenty-two beds, and access to this is gained from the main staircase, which is at the northern end, by a spacious corridor. Off this corridor are, on one side, an operating-room, two special wards of two beds each, a waiting-room, a demonstration-room and a physician's room; and on the other a kitchen, a bath-room (with three baths), a lavatory and other conveniences, an isolation ward, a linen-room, and a parlour and bedroom for the nurse in charge. Besides these rooms, stores for pails, brushes, &c., separate lifts for food and patients and a store for patients' clothes are provided off a cross corridor. The baths, &c., in connection with the large ward are placed in circular towers at its southern end. It will be noted that the nurse in charge sleeps and lives night and day close to her patients, instead of being removed from them, at least during the night. This is, however, rendered necessary by the nature of the diseases under treatment in this pavilion. The operating room is simply lighted from both the north and west. The windows are set in steel frames of large size and the whole window can be instantly opened wide, like a huge door, to admit fresh air. This is sometimes found useful while patients are under the influence of ether or chloroform. The waiting-room and demonstration-room can, when not in use, be thrown into one by means of a movable partition and they then serve as a convalescent-room for patients. The attic floor contains fourteen separate rooms for nurses and nine separate rooms for servants, besides bath-rooms, lavatories, &c. The pavilion altogether provides accommodation for about ninety-

seven persons, excluding the two houses in the basement floor. In the construction of the pavilion no straps or lath is used. The walls are lined with brick, with a hollow space between it and the main wall. Glazed tiles are freely used, both in walls and floors, in corridors, bath-rooms, lavatories, kitchens, operating-rooms, staircases, &c. The floors are constructed of iron and concrete, without wood joists. The ward floors are laid with hardwood planks, but these are nailed into a thick coat of specially prepared asphalt, laid above the concrete. The whole building is thus practically fireproof. In accordance with modern theories as to germs, all corners are widely rounded, and cornices, door mouldings, &c., are almost entirely absent. The pavilion is warmed by steam in pipes and coils. Fresh air is admitted at various points, and the foul air is to be removed by electric fans, placed in a specially designed tower at the north-east corner. The lighting is to be by electricity. On the south front, between two of the upper floors and forming a balcony are large panels, which will contain suitable inscriptions, stating that the building was erected to commemorate the sixtieth year of Her Majesty's reign. The total cost of the pavilion is expected to be about 40,000/. The architects are Messrs. Sydney Mitchell & Wilson, 13 Young Street.

PATENTS FOR INVENTIONS.

A VOLUME of classified abridgments of specifications of patents for the period 1884-88, dealing with class 20, "Buildings and Structure," has been issued from the Patent Office, and will shortly be followed by other similar volumes. With regard to the object of these publications, the Comptroller-General of Patents, Designs and Trade-Marks furnishes the following statement:—The Patent laws of this country make no provision for an official search as regards novelty, and all patents are taken out at the risk of the inventors. It is therefore incumbent on any person desiring to obtain a valid patent for an invention either to cause a search to be made or himself to make a search as to the novelty of his invention. By omitting such a search many a patentee has found, after paying his fees, that his treasured patent is worthless, because it has been anticipated. Of course in this case the first applicant or patentee possesses all the patent rights, and the second one has absolutely no rights at all. A complete and exhaustive search through published specifications of patents

is a task of considerable difficulty, even for the trained expert with all the resources of the Patent Office library, for at this moment the number of printed specifications of patents is well over a quarter of a million. A series of indexes and abridgments has been published by the Patent Office as a guide to the specifications themselves, and is freely distributed to the principal public libraries in this country. The abridgments give a general description of the nature of every invention patented, and the object of their publication is to enable the would-be patentee to carry out, at any rate in some cases, what may be termed a fireside search. By the study of these abridgments he will generally be able to select certain inventions which have already been patented, and which resemble his own invention sufficiently to render it desirable for him to examine their specifications in detail. A printed copy of any specification can be obtained at an inclusive price of 8d., through any post-office, by a special postcard (patents form, C¹). The abridgments are published in volumes, each volume dealing with one particular class of inventions, such as "steam-engines" and "cooking and kitchen appliances, &c." for a period of some years. The volumes up to 1877 are not illustrated, and all the subjects have not yet been dealt with, but from 1877 onwards a systematic series, very fully illustrated, is now in course of publication at a uniform price of 1s. per volume (including inland postage). The volumes for the periods from 1877 to 1883 and from 1884 to 1888 have been completed, those for the periods from 1889 to 1892 and from 1893 to 1896 are in active preparation, and later volumes will follow in due course. For the purposes of the abridgments the whole field of invention has been divided into 146 "abridgment classes," and the list of these classes in itself shows what an enormous field this is, and how greatly its products vary. Every triumph of applied science, such as the locomotive, the telegraph and the dynamo, is to be found here, and every one of our great national manufactures and industries finds its appointed place. Each volume contains abridged descriptions of the inventions falling under one of the 146 classes during the period of which it treats (illustrated by diagrams or drawings wherever possible), a detailed index to the inventions according to their subject-matter, and an index to the names of patentees or applicants. For the use of those who desire to make a careful study of patents, the Patent Office also publishes an "abridgment-class and index key" (price 1s., parcel postage 5d.), which shows in detail how inventions are classified, abridged and indexed throughout its publications.

PAINTS FOR IRON AND STEEL.*

THIS paper records the result of considerable thought, study and time, which have been given to the above subject during the last three years in making careful laboratory examinations of the various paints sold in the markets as "anti-rust," and under other names, and in practical experiments.

The compilation of the work thus far done is given in a condensed form only; therefore the usual style of reporting is reversed, and the recommendations and conclusions arrived at are given at the beginning.

From our present knowledge the following system for painting iron and steel bridges and other metallic structures is recommended:—

1. Give the iron and steel a coat of the best grade of refined linseed oil, properly boiled and settled clear; or, still better, mix linseed oil with about 10 per cent. of a good grade of lamp-black; this coat to be applied at the mills, the iron or steel being first carefully cleaned from loose scales.

2. After the structures have been erected, give them one coat of real asphaltic varnish paint, made from the best grade of asphalt, linseed oil and gum, compounded properly, so as to form a true varnish; or of a paint made from carbon black and a properly boiled varnish, compounded of the best grade of linseed oil and gum. This coat should be carefully applied by a skilful painter after the metal has been thoroughly cleaned from all loose scale, rust, shavings, filings, shrivelled oil and paint, grease, dirt or any foreign matter, because it is of the utmost importance that the paint should be spread and worked in such a way as to cover the surface properly, and be as free as possible from air bubbles and from a continuous coating. This priming or first coat should be applied fairly thick, the thickness depending, to some extent, on the nature of the paint used. Before the second coat is applied the first one should be thoroughly dried and hardened by natural oxidation, which will require at least ten days. If practicable, it would be a great deal better, as well as more economical, to apply the second coat not less than four weeks after the first one.

3. As a second coat, a good coat of graphite paint is applied as thickly as possible, working the paint thoroughly with the brush. From the examinations made of the various grades of graphite paints, as far as graphitic pigments are concerned,

there appears to be but little difference between them, provided of course that the pigment contains at least 33 per cent. of pure graphite, the rest of the pigment being natural rock ground very fine in pure linseed oil. The graphite paint should be bought in paste form, well ground, and contain not less than 70 per cent. of pigment and 30 per cent. by weight of the best quality of boiled linseed oil; the paste should be mixed with boiled linseed oil at the place where it is to be applied. No turpentine, no benzine and no Japan or driers should under any circumstances be allowed in this paint.

The system just described, if properly carried out, will give a protective coating which will last for many years, and it is firmly believed that this system of painting (provided that the paints are of the best quality) will protect iron and steel for a longer period than any other system now in vogue.

4. There are certain parts of steel or iron bridges, viaducts or tunnels that should have an additional (third) coat of paint. These include such places or parts of structures as are directly exposed to the steam, fumes and gases from passing engines. For such a coat some cheaper asphaltic paints applied very thickly over the coats above recommended would be all-sufficient. Such a coat would protect the underlying primary coats for many years, preserving their natural toughness and elasticity and preventing atmospheric action on the structure.

In recommending asphaltic varnish paint or carbon paint for the first coat, great stress is laid upon the necessity of having the surfaces of iron or steel as free from moisture as possible while the structures are being painted, otherwise there is great danger that the coating will not adhere very firmly, and that it will thus actually nullify the value of the paint. This precaution is less important when an ordinary iron-oxide paint or red-lead paint, simply mixed with linseed oil, is used; because linseed oil itself has the property of absorbing moisture quite readily, whereas carbon or asphaltic paint will not. The lack of this property in the two last-named paints is one of the principal reasons why they are superior to any other class of paints.

Although it is proper that true economy should always be exercised, preference should not be given to any paints whose properties lie simply in the fact that small quantities of them cover great areas. Often the first question asked is: "How many square feet can you cover with a gallon of your paint?" cheapness being considered the most important factor. Of course, the greater the number of feet that can be covered with one gallon of paint the thinner will be the protecting coat.

There is a limit beyond which it is inadvisable to carry this. Other things being equal, the paint that can be spread over a fairly good area should be considered superior to any which goes to the extreme either way.

The various paints examined are classified under the following heads:—

1. True asphaltic varnish paints.
2. So-called asphaltic varnishes or paints of inferior qualities.
3. Black carbon paints in which the vehicle is practically a varnish.
4. Iron-oxide paints, consisting of more or less iron oxide with more or less siliceous matter and compounds of lime or of magnesia.
5. Graphite paints and silica graphite paints.

The tests were carried on through periods ranging from six months to over two years. The number of paints subjected to test was twenty-two. All these paints have been analysed chemically to ascertain the quality of material used in them.

The true asphaltic varnish paints are compounded in the same manner as the black japans, known as baking japans, and are made practically in the same way as varnishes, from linseed oil, gum asphaltum and turpentine. Some of them contain carbon black and a small amount of inert mineral matter.

The carbon paints consist, as regards the pigment, mostly of carbon black with some white lead; the vehicle in which the paint is ground is practically a linseed oil varnish, thinned down with turpentine. These two paints are closely related to one another and are comparable. Both are considered to be of great value for the protection of iron and steel, if properly applied.

The asphaltic paints of inferior quality, which might be of value as a last coat, or wearing coat, especially on certain parts of bridges, viaducts or tunnels, are made of asphaltum dissolved in benzine or other volatile oils, but are not a true varnish made from linseed oil. They contain about 43 per cent. of volatile oils and 56.5 per cent. of solid carbonaceous bitumen (asphaltum).

In using these paints, namely, asphaltic dissolved in benzine, in mixtures of benzine or rosin spirit, or in other light neutral oils, the principal trouble is that in spreading them over oiled surfaces the light oil evaporates so fast that it is difficult to spread them properly. There is also another objectionable feature in connection with the benzine paint, namely, that where such a paint is applied to iron surfaces, the rapid evaporation of the benzine absorbs a great deal of heat, and if the air

PRICE LISTS and FULL PARTICULARS on APPLICATION.

should happen to be highly saturated with moisture at the time, the reduction in the temperature of the surface of the adjacent iron may cause a condensation of moisture, preventing the paint from coming in close contact with the iron and producing a tendency to blister.

These cheap asphaltic paints may show up well enough in the beginning, but as a rule, after the volatile oil has evaporated, especially in subjecting the painted iron to the heat test, the coats become quite brittle, can be easily removed by abrasion and do not protect the iron against rust.

As a matter of interest it may be stated here that one of the so-called asphaltic paints when analysed chemically showed no asphaltum at all.

The iron-oxide paints were of different grades and qualities. It is not the intention of the writer to give their chemical analysis, because every paint was compounded differently and contained more or less iron oxide and siliceous matter. As a rule the paints were well ground, and spread and covered to a satisfactory extent.

As stated before, the graphite paints contain from 33 to 83 per cent. graphite, the balance being inert insoluble matter, consisting mostly of compounds of lime, magnesia, alumina and iron oxide.

Besides the chemical examination, the paints were subjected to a systematic practical test to ascertain their real values as anti-rust paints. For that purpose comparative tests by painting pieces of sheet iron, tinned iron and galvanised iron, wooden boards and shallow sheet iron dishes, were carried on. The iron dishes were about 12 inches in diameter and about $\frac{1}{2}$ inch deep, having a capacity of about half a pint. The scale or skin was carefully removed before painting, so as to have a clean surface of iron exposed next to the paint. Two dishes were painted with each kind of paint, one of them receiving one coat, the other two coats, the first coat having dried thoroughly (for at least a week) before the second coat was applied. After the second coat had completely dried and hardened, these dishes were exposed to the so-called water-and-moisture test, in which a given amount of water is placed in the dishes and allowed to evaporate to dryness at the ordinary temperature of the room. This is repeated a number of times until the inside of the dishes begins to show more or less rust. All dishes were carefully examined before each refilling. After most of the water has evaporated, there remains at the junction around the edge a thin film of water which, in contact with the air and with the carbonic and other acids in the air, acts on

the paint in such a way that the iron under the paint begins to rust. The rust thus formed develops more and more after each evaporation, in some cases practically covering the whole dish in a short period. In actual practice and service the same thing will happen, the only difference being that the rust will extend under the paint, and will not show as plainly as on the dish. This test is a most important and severe one for the purpose of determining in a relatively short time the weather-resisting power of a paint. If the paint is unable to resist the action of the water or moisture under these conditions, it cannot be desirable for the protection of iron or steel structures. But other qualities in the paint have to be taken into consideration in connection with this test before a correct opinion as to its merits can be formed.

The dishes painted with true asphaltic varnish and with the carbon paint were refilled fourteen times. The dishes painted with one coat showed very little deterioration, while the dishes with two coats showed none at all, the paint being as elastic and tough as when first applied.

The behaviour of the cheap and inferior so-called asphaltic paints, applied on the surface of the dishes, was quite different. After the fifth exposure, the dishes with one coat showed considerable rust all over. Those with two coats, after the seventh exposure, showed not much better.

Quite a difference was apparent in the test of the iron-oxide paints. On the average, after the fifth exposure, a good many rust spots or specks appeared on the surfaces of the dishes painted with one coat. The dishes with two coats were refilled six times and on them rust could be easily detected with the naked eye.

The graphite paints so far examined acted much the same in comparison with one another; although, upon chemical examination of the samples submitted, quite a variation was found in the amount of graphite present in the pigment.

The object of procuring graphite in the form of paste was, in the first place, to get the paints ground only in boiled oil, so that they could be thinned with oil before painting under exactly the same conditions; second, if after the examinations and tests any difference was found, it would be easy to ascertain whether or not such difference was due to the amount of graphite present. In mixing these different graphite paints with boiled linseed oil, ready to apply, $4\frac{1}{2}$ parts of paint and $3\frac{1}{2}$ parts of oil by weight were used. As all these graphite paints were received at about the same time, all the comparative tests were made under exactly the same conditions, and all

moisture or water tests were made side by side. Therefore the results obtained so far are comparative, and consequently of more value than otherwise would have been the case. All the dishes with one coat were exposed ten times to the water test, and on examining the records it will be observed that all these graphite paints began to show a few specks of rust after the fifth evaporation, and that the number gradually increased after each successive evaporation. After the tenth exposure some slight difference between them is shown, but not very much. All the dishes given two coats have so far been exposed thirteen times, and none of them show any rust or indication of rust. The natural toughness and elasticity is still in the paint after the treatment.

Besides this moisture-and-water test, all paints have been subjected to a heat test, by placing painted sheet-iron in the core oven of the brass foundry of the Great Northern Railway shops. The temperature of this oven varies from 220 to 300 deg. Fahr., and as the fire is a direct one, all the gases of combustion, such as carbonic acid, sulphurous acid and watery vapour, came in direct contact with the painted iron. This test is of value also as showing promptly whether a paint will keep its elasticity or will become brittle so that it may be easily removed from the surface. In several instances this test brought out serious defects in some of the paints examined, which had shown fairly good results in the other tests. This was the case especially with the cheaper so-called asphalte paints.

After a month's exposure to the heat of this core oven, the painted pieces of sheet-iron were examined, and the asphaltic varnishes, carbon paints and graphite paints only were then found in good condition, although the paint had become very hard owing to the thorough oxidation and hardening of the linseed oil. These three paints adhere very firmly to the iron after the heat treatment; in fact, they seem to be more strongly attached to it than to a painted surface not exposed to heat.

The exposure of the painted iron to this high temperature is not exactly the same condition to which it will be subjected in actual service; but this test in connection with the others is of value, because if the paint should become very brittle or should flake off and be easily removed from the painted surface during this test, it will surely do so in practice after a long exposure to the direct action of the sun and to great variations in temperature.

The writer wishes to give due credit to Dr. P. H. Conradson, who very skilfully carried out these tests when at the head of the Great Northern Laboratory.

THE NEW EDINBURGH ASYLUM.

THE report prepared by the deputation of the Edinburgh Lunacy Board, which recently visited the principal asylums on the Continent and in England in connection with the proposed new asylum for Edinburgh, has now been considered by the Lunacy Board. The deputation recommended the adoption of the Alt-Scherlitz system, the basis of which is the segregation of the patients by means of separate dwellings, with home-like surroundings, the conditions of life being, in fact, very much like those in a village community. The Board have unanimously approved of that recommendation, and a remit has been made to Mr. W. W. Robertson and Mr. Peter Lawrence, acting along with Dr. Sibbald, Commissioner in Lunacy, to report upon the most adaptable site on the estate of Wester Bangour, by Uphall, which has been purchased by the Board for the purpose. The estate cost 13,000*l.*, and it is expected that the complete asylum will entail a burden on the ratepayers of the city amounting to about 100,000*l.* The estate is beautifully situated about three miles from Uphall. The Commissioners in Lunacy have expressed cordial approval of the place and its surroundings. Accommodation is to be provided in the new buildings for 600 patients.

ST. STEPHEN'S NATIONAL SCHOOLS, WESTBOURNE PARK.

THE important extension of these schools, which were opened on the 30th ult. by the Right Rev. Mandell Creighton, D.D., is designed to incorporate the existing building so as to form one large school equipped with all the improvements of modern school buildings so far as a close study of cost would allow. The site is a fine open one on a broad street, with the immense area of the Great Western Railway goods yard in front, so that the school buildings are visible at a long distance and enjoy both light and air to an unusual extent.

The new scheme divides the children into three isolated divisions on different floor levels, with separate entrances and staircases. It supplies the great want of classrooms, in addition to the old schoolrooms, the idea being to have, in addition to their schoolrooms, as at present, one infants' classroom and three ditto for boys and girls respectively. The scheme also gives a cloak-room to each department, whereas in the old

A Splendid Example of Colour-Work in Permanent Ink Photo,
BY M. PAUL ALBERT BAUDOIN.

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—*The Lady's Pictorial*
"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage*
"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced at subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—*The Gentlewoman*.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 Strand, W.C.

May be had framed in Solid Oak Frames with Mounts, at Three Guineas the set of Five Plates.

buildings there was no proper provision for this purpose, besides which a separate playground is now allotted to each school, where formerly all had to use one small courtyard in common. Lastly, the lavatories are now all outside instead of inside the main buildings and upon the proper scale, whereas before they were inadequate in number and very unwholesome. In view of the above defects the old buildings were about to be condemned by the Educational Department, being, moreover, very much overcrowded in all schools. Part of the scheme has been postponed for the present, but the actual increase in the numbers of places provided will more than double the former accommodation.

The new extension occupies the site of three houses which were purchased for the purpose and pulled down, the frontage of the schools being thus doubled.

The distribution is as follows:—The basement is used for parochial purposes in connection with the adjoining house. Half of the ground floor provides a small schoolroom 24 feet by 30 feet, the remainder is occupied by the new girls and boys separate entrances and staircases, as well as by the cloak-rooms for both departments. The first floor gives two large classrooms for sixty children each, while the second floor is the same except that here the two rooms can be thrown into one by means of a folding partition.

The schools are lighted throughout by electricity, and are probably one of the first of the national schools to be so lighted. This work has been executed by Mr. W. Mackie.

The building has been erected by Messrs. Rudd & Son, of Grantham, under the personal supervision of the architect, Mr. Arthur T. Bolton, of 2 The Sanctuary, S.W. The cost has been about 7,000*l.*, including the site, which cost 2,000*l.* The money has been nearly all raised in the locality, chiefly in the parish of St. Stephen's, Westbourne Park, through the zeal and energy of the Rev. M. R. Neligan, the vicar.

The general contractors are Messrs. Rudd & Son, of Grantham, and the architect is Arthur T. Bolton, A.R.I.B.A., 2 The Sanctuary, S.W. The Monks Park stone was supplied by the Bath stone firms, the red moulded bricks in chimney-stacks by Messrs. Wheeler, Reading; imperial green slating by Messrs. Roberts, Adlard & Co., London; fireproof floors and staircases by Messrs. Ward & Co., London; woodwork flooring by Messrs. Turpin, London; Messrs. Adams & Co., London, were responsible for the school sanitary fittings, and Messrs. Peace & Norquoy, Manchester, for the patent folding screen partition to architect's design; the quantities were prepared by

Messrs. Widnell & Trollope, Broadway Chambers, Westminster; Monsieur Chavalland, of Messrs. Farmer & Brindley, who has modelled the heads above the entrances and the angels flanking the foundation-stone, executed the sculpture; the painted frieze at the foot of the girls' stairs is the work of Mr. George Walton.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 23934. Dennis Magrath, for "Sash bead fastener."
- 23962. Frederick Stanley Cox, for "An improved appliance for holding together the cords of window-blinds and similarly suspended articles."
- 24001. Alfred Lucas Henry, for "Improvements in dampers chiefly intended for use with kitchen ranges."
- 24040. John Partridge, for "Improvements in the mode of applying and working window roller blinds."
- 24063. Frederick Harry Heath, for "Improvements in apparatus for preventing the steaming of shop or other similar windows."
- 24125. Maurice Comerford, for "Improvements in binding staples."
- 24139. William George Jarvis, for "An improvement in the manufacture of bricks for fixing purposes."
- 24149. Charles Parker Dyer, for "Improvements in detachable joints for mechanical bedsteads."
- 24176. Reginald de Monfort Linstead, for "Improvements in finger-plates for doors."
- 24219. Daniel Hurst, for "Improvements in flushing cylinders for water-closets."

To INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from $\frac{1}{4}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{3}{8}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

SUPERANNUATION CONFERENCE.

AN adjourned meeting of the Conference (convened by the Municipal Officers' Association), with Mr. C. William Tagg as chairman, was held at Sion College on November 4, when it was unanimously resolved to reintroduce the Local Authorities Officers' Superannuation Bill in the next session of Parliament, and the necessary steps will at once be taken to secure this object. Mr. Tagg (chairman) and Mr. C. J. F. Carnell (hon. secretary) were unanimously re-elected to the respective positions and accorded a very hearty vote of thanks for their services during the last year. A committee, consisting of Dr. Dudfield, Mr. Chaloner, the chairman and hon. secretary was appointed to confer with other associations in support of the Bill. Representatives from the following bodies were present:—The Incorporated Society of Medical Officers of Health, The Municipal Officers' Association, The Metropolitan Rate-collectors' Association, School Board for London (Head Office Staff), Rural District Councils' Association, Poor Law Officers' Association, School Attendance Officers' National Association, London School Board Officers' Association, the Library Association, Schoolkeepers' Association and the County Surveyors' Society. Mr. C. J. F. Carnell, the hon. secretary, 33 Paulet Road, Camberwell, S.E., will be pleased to furnish any information respecting the measure.

TRADE NOTES.

MESSRS. WILLIAM GODWIN & SON, encaustic, enamelled and art tile manufacturers, Withington, near Hereford, have just opened a London office and sample room at 15 Bartlett's Buildings, Holborn Circus, E.C.

THE Imperial Stone Company, Limited, whose works are at East Greenwich, have taken City offices and opened show-rooms at 4 and 5 Aldgate, E.C.

THE new sanatorium, Brighton, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, and Shorland's patent Manchester grates.

THE chancel of the parish church of Bottesford, near Grantham, which already contains many handsome memorials of the family of the Duke of Rutland, has been further enriched by the insertion of another stained-glass window to the memory of the late rector, Canon Norman. The window contains three

lights which respectively portray the texts, "I am the Light of the World," "I am the Bread of Life" and "I am the Good Shepherd." The window, which is very effective, is from the studio of Messrs. Jones & Willis, of Birmingham, London and Liverpool.

THE plates of the cathedrals as well as of modern buildings which we are now publishing, suggest the excellence of the photographs of Messrs. S. B. Bolas & Co. It will excite no surprise that the medal of the Royal Photographic Society has been awarded to Messrs. Bolas, who may claim to stand in the foremost place among photographers, owing to the skill by which they contrive to show details of buildings without any sacrifice of breadth. Their plates may be described as architectural and pictorial in quality.

BUILDING AND BUILDERS.

THE London County Council have passed plans for the erection of a new theatre in the Holloway Road, subject to the condition of making a new side street, for purposes of entrance and exit. The site is a large piece of ground almost adjoining the High-bury and Islington railway station.

A NEW cricket pavilion is to be erected by the Sussex County Cricket Club at Hove, which is to cost about 600*l*.

MEMORIAL stones of a new Congregational church, which has been erected at Mount Pleasant, Swansea, were laid on Thursday, the 4th inst. The building has cost 1,400*l*. and the erection has been carried out by Mr. Thos. Davies, from plans prepared by Mr. W. Williams.

ALL the necessary arrangements have now been made for commencing the extensive alterations and improvements in connection with Pontefract workhouse. These consist of developments of the accommodation for vagrants, and extensions of the laundry arrangements. The total amount involved is 7,695*l*. Mr. W. H. Greaves, of Pontefract, is the architect.

THE Metropolitan Asylums Board have, on the recommendation of the works committee, accepted the offer of Messrs. E. P. Bulled & Co., of Croydon, to take over a contract for the erection of a nurses' home at the Caterham Asylum, and complete it at the sum of 5,500*l*.

A NEW church is about to be erected in the parish of St. Andrew, Listerhills, Bradford. Mr. G. E. Turner has given a site in Horton Grange Road, and Mrs. Turner, of Westfield,

UNEQUALLED · FOR · **ALL** · DECORATIVE · PURPOSES.

Aspinall's

ENAMEL

For Inside and Outside Work.

READY FOR USE.

This Enamel, which has taken the Highest Award wherever exhibited, imparts a rich glossy appearance to all surfaces to which it is applied, and dries with a hard impervious surface as washable as porcelain. It is admirably adapted for use in Hospitals, Public Institutions, Mansions, Private Houses, &c., where sanitary conditions are of the first importance. One gallon will cover about seventy square yards on a non-porous surface, and is equal to about three gallons of mixed paint.

ASPINALL'S ENAMEL can be made to any tint, is absolutely non-poisonous, and is unequalled for *all* decorative purposes.

Builders and Decorators should apply for full particulars of our special "DECORATOR'S" ENAMEL.

ASPINALL'S ENAMEL. LTD., NEW CROSS, LONDON, S.E.

has promised to give 1,400*l.* towards the endowment fund and 1,000*l.* towards the building fund in memory of her eldest son, the Rev. John Turner, at one time curate at Whitby.

A SITE has been secured for a new technical school for Harrogate, the present building being too small and unsuitable. The site selected is situated at the junction of Bower Road and Hayura Crescent, and the committee have decided that local architects be invited to send in competitive designs, for which prizes of 20*l.*, 10*l.* and 5*l.* will be offered. The chief room is to be at least 45 feet by 35 feet; whilst a number of smaller rooms are to be provided for the teaching of the many subjects now taken at the Harrogate School of Art. It is desirable that a large room should be available for conversaciones, &c., and it is suggested that the elementary, building and lecture-rooms should be so designed as to be convertible into one large room, and thus give the space required. The main entrance will be in Hayura Crescent, and the building will be so constructed as to allow for extension if necessary. The building proper will be of stone, and the cost (including heating, &c., but not architect's commission and clerk of works' salary) is not to exceed 3,500*l.*

ELECTRIC NOTES.

THE Harbour Commissioners of Aberdeen have adopted a scheme for the lighting of the quays and harbour sheds by electricity. Electric beacons will also be provided at the dock entrances for the better navigation of vessels at night. The supply of the current will be taken from the Corporation mains. The annual cost is estimated at 1,700*l.*, but of this sum 250*l.* will be contributed by the Town Council for the lighting of the streets around the quays.

IN the last Parliamentary session the St. Anne's Urban Council promoted a costly Bill to acquire the gasworks, but lost their measure. Soon afterwards an electric-lighting company served the Council with notice of their intention to apply for a Board of Trade order to supply the district with electricity. Despite this the Urban Council have decided unanimously to apply for a provisional order. Complaint was made as to the bad lighting of the new esplanade and it was intimated that in future the electric light would be used there.

AT a recent meeting of the Perth Police Commissioners the question was discussed of the introduction of the electric light into the city. A long statement on the subject was made by a

consulting electrical engineer from London, who has had charge of the installations in many large towns. He dealt with the possibilities of the project in the hands of the Corporation, and indicated in a general way the financial risks that would be involved. His statement was in favour of the Corporation taking the project into its own hands in preference to handing it over to a company. In particular, instances were given of corporations being compelled to pay large sums when taking over the rights of private companies, in whose hands the installation of the light had originally been placed. After the statement the feeling among the Commissioners present was that the proposal that a company should be allowed to get a provisional order for the introduction of the light into the city was the wrong one, and that the city itself had much better undertake the scheme.

AT the meeting of the Marylebone Vestry held on the 28th ult. it was unanimously decided, on the motion of the chairman of the electric-light committee, Mr. Brooke-Hitching, to give formal intimation to the Board of Trade and the Metropolitan Supply Company, Limited, of the vestry's intention to apply for a provisional order for supplying electric energy for public and private purposes in the parish of Marylebone. It is now to be hoped that this important parish, whose rateable value far exceeds that of Leeds, Sheffield, Brighton or Portsmouth, may speedily light Oxford Street, Edgware Road, Marylebone Road, Portland Place and other important streets within its area by means of the most approved methods of electric lighting. Many of the private houses in this district are already lighted by the Metropolitan Electric Supply Company, Limited. Board of Trade orders are also being sought by the London County and Brush Company, Limited, and the Marylebone Electric Supply Company, Limited, to compete. The chairman gave as his opinion that the value of a full Board of Trade order was not less than 10,000*l.*

A LOCAL GOVERNMENT inquiry has been held at Harrogate by Major-General H. D. Crozier, R.E., with respect to the application of the Corporation to borrow 17,500*l.* for the purpose of electric light extension. The Harrogate Corporation during the early part of the year put down an installation, 25,246*l.* being borrowed for the purpose in 1896. A portion of the centre of the town has been lighted, and though further applications have been made for the light it is impossible to comply with them without an extension of the plant. At present there are in use in the town 7,366 eight candle-power lamps, and during September the income was 251*l.*, whilst the expenditure,

147 STRAND, LONDON, W.C.

including repayment of interest and a portion of the sinking fund, was 253 $\frac{1}{2}$ l. The town clerk (Mr. J. T. Taylor), Mr. G. Wilkinson (electrical engineer) and Colonel Thwaites (chairman of the committee) gave particulars of the work. After the necessary evidence and a vote of thanks, the inspector viewed the electric-lighting station on the Corporation Farm.

THE cost of electric light in Leeds is about to be again reduced. The Yorkshire House-to-House Electricity Company have had in progress a large extension of their works and plant, and after considerable delay caused by disputes in the building and engineering trades, the new machinery is now in operation, and the company are thus prepared to produce a much greater output than has hitherto been possible; hence the possibility of introducing the reduced scale of charges. The present standard price in Leeds, as in most other large towns, is 6d. per unit. On and after January 1 next the maximum price will be 5d. per unit, and this is reduced to 4 $\frac{3}{4}$ d. in cases where the consumption for the quarter is not less than 1,000 units. The special advantages are not confined to large users, as the present system of discounts, based on the number of hours during which the lamps are used, is continued. Hitherto a hindrance to the use of electric light has been the charge for connecting consumers' premises to the mains. In future occupiers of premises situate within 10 feet of the public road will be able to have the connection made free of charge. This concession comes into effect at once.

THE installation of the electric light in the village of Treeton, near Rotherham, is now an accomplished fact. The enterprise shown by the Treeton Parish Council in putting down an electric-light plant has caused a good deal of interest throughout the country, inasmuch as Treeton is believed to be the only village in England which has its roadways illuminated by electricity. During the last few years Treeton has become an important mining centre, and the population has grown enormously in consequence. It is a unique coincidence that this village, which has the honour of leading the way in the matter of village lighting by electricity, should be the birthplace of Sir Wm. Cooke, the inventor of the electric telegraph. The scheme, which has cost about 600 $\frac{1}{2}$ l., has been carried out by Messrs. Dewhurst & Sons, of Sheffield.

THE parish church of Halifax was reopened after renovation on Saturday afternoon.

VARIETIES.

ENGLISH Churchmen are arranging to build at Lucerne a new church for the use of English-speaking residents and visitors. The building and site will cost 7,000 $\frac{1}{2}$ l.

A TERRIBLE explosion took place recently at the engineering works of Higginson & Co., Mersey Street, Liverpool, resulting in serious injury to eight men.

THE Bishop of Chichester recently opened new science and other rooms, which have just been added to Brighton Training College.

A SITE for the proposed Technical Institute at Harrogate has been chosen at the junction of East Parade and Bower Road. The cost of the building will be about 3,500 $\frac{1}{2}$ l.

THE opening ceremony in connection with the Queen Victoria Institute for Nursing the Sick Poor of Reading, which has been founded by local effort to commemorate the Diamond Jubilee of Her Majesty, was performed on the 5th inst.

THE chapel of St. Nicholas, at Mostyn House School, Parkgate, Leeds, was, on the 4th inst., dedicated by the Right Rev. the Lord Bishop of Chester. The new building provides accommodation for about 200 worshippers.

MR. DUNCAN MACLENNAN, clerk in the office of Dr. Naismith, sanitary inspector of Cupar Fife, has been appointed in succession to Mr. John M'Kenzie, who has been appointed to the Kirkcaldy district of Fife County Council.

THE ancient parish church of Duffield, near Derby, has been thoroughly restored, a new side aisle has been added and a stained-glass window erected. The work has been done by Mr. Bridgeman, of Lichfield, and has cost some thousands of pounds.

THE opening meeting of the winter session of the Northern Architectural Association will be held at the Meeting Room, Art Gallery, Newcastle-upon-Tyne, on Wednesday next, November 17, at 7.30 P.M. The president (Mr. Frank W. Rich) will deliver his inaugural address.

ST. MARK'S new schools and parochial hall, Dublin, were opened on Wednesday last. The new buildings consist of boys, girls' and infant schools, which will accommodate 500 children. There are classrooms and a kitchen in which the elder girls will be taught cookery and laundry work. The old school has been turned into a parochial hall, and a large piece of ground at the rear will be utilised as a playground.

In the official list of awards of the Brussels Exhibition, just published, Messrs. Farmer & Brindley, in the British section, are awarded a gold medal for their exhibit of Egyptian porphyry. Two medals are also awarded to the Verde Antico Marble Company; one for choice quality of the material, the other for skill in design of objects exhibited in the marble. The old Egyptian quarries of porphyry, and the Thessalian Verde Antico marble, were both rediscovered by Mr. Brindley.

CALSHOT Castle, a defence originally built in the reign of Henry VIII., and now remodelled for the protection of the entrance to Southampton Water, has hitherto been included in the group of Portsmouth and Spithead Forts. Owing, however, to its position, it has been decided that it shall form the 1st inst. form part of the system of fortifications embraced by the Isle of Wight sub-district.

THE Midland Railway Company have under consideration a scheme for the construction of a central station in Sheffield. The long distance at which both existing stations are situated from the centre of the city is the cause of great inconvenience to the travelling public, and is believed to be operating against the further development of Sheffield.

DURING the progress of Divine service at Marylebone Presbyterian church on Sunday last a loud explosion took place, followed by dense clouds of vapour rising from the centre of the building. The church has accommodation for 1,500 people, and was at the time of the explosion filled. A panic ensued, but no one was injured. The explosion, as was subsequently ascertained, was due to the bursting of one of the hot-water pipes.

A SMALL syndicate, with a capital of 5,000*l.* in 5,000 shares of 20*s.*, is in course of formation, having for object the development of Sardi's gas generator, which is described as a complete and safe apparatus, enabling consumers to continuously and

automatically manufacture their own gas (acetylene) for illuminating purposes, being equally available in outlying districts as in London itself.

THE illuminating power of several lighthouses has been considerably intensified on the dangerous French coast line at the entrance to the English Channel. Since the loss of the *Drummond Castle* and several other vessels there last winter, the French authorities have had the matter under consideration. In addition to intensifying the penetrating power of the existing light, a new lighthouse has been erected, and others are to follow on the Ushant coast.

THE Bristol Town Council have, in consequence of a statement by the Chairman of the docks committee as to the result of interviews with the Great Western and Midland Railway Companies, rescinded the resolution passed at a previous meeting to apply next session for a Bill to construct new docks at Avonmouth, and gave instructions to the committee to continue negotiations with the railway companies and report to the Council next March, with a view to applying for a Bill next session.

AT a meeting of the committee entrusted with the restoration of Stratford-on-Avon parish church (the burial-place of Shakespeare) it was decided to rebuild the electric organ, and to improve the heating apparatus of the nave. Other work contemplated is the relaying of the floor of the nave, the provision of new oak benches and repairs to columns supporting the arcading. The utmost care is being exercised in preserving all the ancient characteristics of the edifice. On the work of restoration 6,000*l.* has already been expended, and an additional sum of 5,000*l.* is required to make it complete.

EDDLESTON (N.B.) parish church was reopened on Sunday last. It is almost a year since the interior of the church was completely gutted by fire, only the walls being left. The church as restored presents a very comfortable appearance. It will be heated by hot-water pipes. Previously there was no vestry in connection with the church, but a neat and commodious one has been added. The restoration of the church is estimated to cost about 1,160*l.*

ON Saturday afternoon an accident happened at Troon new graving dock, at present in course of construction, by which two men were badly injured. A 4-ton crane on the side of the workings was lifting a block of stone weighing about 3 tons when the glands of the crane snapped, and the crane and stone came to the ground. John M'Farlane and Matthew Semple,

who were employed at the place, were struck by the crane, the former receiving a compound fracture of the left arm and his left shoulder blade was badly smashed. Semple got a severe scalp wound and other injuries about the body.

THE Dumfriesshire and Galloway Natural History and Antiquarian Society has concluded a week's excavation on a site on the farm of Raeburnfoot, in the high-lying parish of Eskdalemuir, about fourteen miles above Langholm. It has been matter of local tradition and report that the place in question had been a Roman camp, but there was no satisfactory proof of it, and the Society undertook the work of excavation with the consent of the parties interested in the ground. It was not necessary to go to any great depth to obtain clear proof that local tradition was well-founded, as a few feet from the surface various small articles were forthcoming which were quite satisfactory to antiquarians; and, besides, a well-defined road was come across, which was still hard and gave proofs of its ancient origin. The excavations were carried out under the personal superintendence of Mr. Barbour, architect, Dumfries.

MR. ROBERT COX, M.P., in opening the second day's proceedings of the bazaar in aid of the building fund of the Episcopal Church of the Good Shepherd at Murrayfield, in the Music Hall, Edinburgh, on Saturday, said he was glad to see that the new church was to be made of stone—not brick—and he thought he might put in a word for good architecture by advising them not to let cheapness ruin their site. There were enough eyesores in the way of churches perpetrated in Edinburgh already, and he earnestly beseeched them to give the work to a capable architect, in whose taste and abilities they had confidence, so that a temple worthy of God might be erected upon the proposed site.

A VERY compact and light-weight driving engine worked by steam has just been constructed by Messrs. Merryweather & Sons, of Greenwich. This engine is on the lines of a very powerful engine built for the War Office, the object being to get great power into a small compass, while at the same time portability is one of the important considerations. The driving engine referred to consequently is suited for export to countries not yet provided with roadways. Developing 8 to 10 horse-power actual, its weight is only 8 cwt., and, being vertical, it can be carried complete on shoulder poles by men. In the event of its having to be carried by mules many miles over hilly country to far inland districts, it is designed to be taken

to pieces readily, no part exceeding 250 lbs. weight. As compared with the ordinary machine sent out to the colonies and other countries having neither roads nor rails, this engine and boiler complete, while being of equal power, is practically one-third the weight. It is somewhat surprising that so few of our prospecting engineers have yet adopted Messrs. Merryweathers' machinery, but perhaps this is owing to their name being so greatly associated with fire-engines. However, the firm goes with the times, and hence their production of engines and pumping plant which meet "up-country" needs both as regards simplicity of construction, strength, efficiency and lightness of weight. When one considers that a Merryweather fire-engine indicating 150 horse-power weighs only 3 tons, one can readily realise the perfection they have aimed at as regards light and substantial machinery.

ON Monday night quite a commotion was caused in Alloa by the announcement that a fire had broken out in the Municipal Buildings. It turned out, however, that the outbreak had occurred in the stables behind the Municipal Buildings proper, and when the discovery was made five or six horses were in their stalls and all the men were away for the night. With difficulty the constables on duty got the horses safely out, but about ten minutes elapsed ere a connection with the street hydrants was made, and by this time the entire hay-loft was ablaze. Once a copious supply of water was secured the firemen succeeded in saving the larger part of the buildings, but the roofs of the stable and soup-kitchen adjoining were entirely demolished, and much damage was otherwise caused by water.

ON Saturday last the members of the public libraries committee of the Hampstead Vestry inspected the just completed new central public library in the Finchley Road, for the building of which Sir Henry Harben, the chairman of the Vestry, presented the parish with 5,000*l*. The new library is a handsome two-storey building, erected from the designs of Mr. Arnold S. Tayler, architect, in the domestic Tudor style. It is built of Cranleigh red bricks, with dressings and mullions of Portland stone, and stands in an easily accessible position in almost exactly the centre of the parish. The upper floor comprises the reference library and reading-rooms and the lower floor accommodates the lending library, with various stores and offices. The library will be opened on Wednesday next by Sir Henry Harben, who laid the foundation stone of the building exactly a year ago on that day.

VERITAS LAMP WORKS,

83, 85, 87 FARRINGDON ROAD, LONDON, E.C.

THE CITY LUNATIC ASYLUM.

THE visiting committee of the City of London Lunatic Asylum recently submitted to the Corporation plans for proposed improvements to the asylum building at Stone, near Dartford, at a cost of 46,770*l.*, and these plans were adopted. It was arranged that the expense should be met by a county rate on the City. The visiting justices afterwards invited tenders for the work from eighteen well-known firms of builders. Three declined, and the remaining fifteen sent in tenders ranging from 59,000*l.* to upwards of 80,000*l.* Those tenders were for the erection of the fabric of the building only, and did not include any machinery, internal fittings, or furnishing. The visiting justices consider that a further sum of 10,000*l.* beyond the amount of the lowest tender will have to be expended on those items and on certain works which have recently become necessary. A very considerable increase has taken place in the price of builders' materials, more particularly in the price of bricks, and owing to the disturbed state of the engineering trade difficulty has been experienced on the part of the firms tendering in obtaining quotations for the ironwork required. Those causes have largely tended to increase the estimate originally formed, and as it is considered of the utmost importance that the works should be at once proceeded with, the visiting justices are seeking to obtain an increase of the grant from the Corporation to 70,000*l.* instead of 46,770*l.*

WOODS AND FORESTS.

THE seventy-fifth report of the Commissioners of Woods and Forests has just been issued as a Parliamentary paper. The income derived from sales of forest produce in the New Forest amounted in the year 1896-97 to 7,355*l.* 4*s.* 11*d.*, in addition to certain surface rents amounting to 3,099*l.* 11*s.* 8*d.*, the corresponding receipts in 1895-96 being 7,060*l.* 12*s.* 7*d.* and 3,014*l.* 13*s.* respectively. In the case of Dean Forest the same sources of income produced 5,305*l.* 17*s.* 7*d.* and 1,856*l.* 12*s.* 11*d.*, as against 6,530*l.* 3*s.* 10*d.* and 1,959*l.* 6*s.* 1*d.* in 1895-96. The mineral royalties of Dean Forest for the year ending March 31 last reached a total of 13,906*l.* 19*s.* 7*d.*, as against 12,332*l.* 10*s.* 8*d.* for the preceding year. The greater part of the oak woods, the report says, have arrived at an age when the income derived from their thinning may be expected to be less than heretofore

for some time to come, and the system of management which was best when the oak was grown specially for the purposes of the Navy requires reconsideration now that it is no longer devoted to the building of ships. It is suggested, therefore, that it is desirable to produce other kinds of timber for which there is a market, and to utilise the oak already planted according to present-day requirements. Turning to other parts of the United Kingdom, the report states that Crown property in Scotland produced during the year an income of 24,737*l.* 16*s.* 1*d.*, in Ireland 37,954*l.* 8*s.* 4*d.*, consisting mainly of quit rents, in Wales 15,107*l.* 12*s.* 1*d.*, and in the Isle of Man 5,654*l.* 7*s.* 5*d.*

THE SANITARY INSPECTORS' ASSOCIATION.

A MEETING of the members of the above was held on Saturday, the 6th inst., in Carpenters' Hall, E.C. The chairman of the Council, Mr. T. G. Dee, presided. A discussion took place on the application of two female inspectors for membership. The names of the two applicants were Miss Alice Tattersall (Lancaster) and Miss Emma Coppock (Manchester). A long discussion took place on the advisability of their admission. Some of the members, in opposing the proposition, urged that women were encroaching into the various businesses that were best controlled by men. Mr. Thomas contended that there were many cases where women sanitary inspectors were more useful than men. The question was then put to the vote, when there were for the resolution 39, against it 49. The proposition was therefore lost. A great deal of excitement afterwards took place, when nine candidates were proposed for various divisions of the Metropolis. In eight cases the full male Christian name of the candidate was given, but one was A. Elliott, of St. George-the-Martyr. A member happened to ask what was the full name of A., and he was then informed by the seconder that it was "Annie." A scene ensued. The name of Annie Elliott was struck out, and the others carried *en bloc*. The Chairman, in his presidential address, reviewed the work done by the Association. Always let them remember that they were banded together in an attempt to obtain a condition for their countrymen in which they might have that greatest of all blessings, health, and therefore if that blessing was to be the result of their labours, it naturally followed that no profession could be higher than theirs.

SMOKY CHIMNEYS

"EMPRESS" SMOKE CURE.

The "Empress" Smoke Cure has held its ground with constantly increasing sales for many years, and is now widely recognised as the best chimney-pot. The chimney which the "Empress" will not cure may be considered hopeless so far as any outside treatment goes. It must be reconstructed or the fireplace altered. At least 90 per cent. of smoky chimneys on which "Empress" is fixed are Cured.

ESTABLISHED 60 YEARS.

Our Foreman in charge of this Department will attend appointments to examine chimneys and advise. For such attendance in London or suburbs no charge is made. For country appointments railway fares only are charged.

IMPEDING WORKMEN.

"A LONDON ARCHITECT," in a letter to the *Times*, writes:—
The correspondence and information appearing day by day in the columns of the *Times* must be gradually educating the public as to the true nature of this dispute. The "eight hours" question is by no means at the bottom of it all.

As an architect I have not been able to avoid noticing the alteration during the last few years in the way in which the workmen proceed in carrying out their duties, and I will as briefly as possible note some of the facts which have presented themselves to me:—

1. There is a clearly-organised and, indeed, compulsory arrangement that the men are to consume the greatest possible amount of time in producing the smallest possible amount of work.

2. And there is an intolerable amount of interference on the part of the men as to the manner in which a builder is to conduct his business.

As to 1. Bricklayers who have been many years in the employ of a certain contractor and perfectly willing to do an honest day's work have been compelled to restrict themselves to laying not more than 450 bricks per day, when they could, in certain work, easily lay 1,000, and they dare not disobey the order. The men generally will stand in groups idling away their time, and will boldly grin at anyone who, by an understood look, expresses surprise at their audacity. This is particularly conspicuous in the men employed by the Works Department of the London County Council and by the workmen employed by vestries and electric-lighting bodies. There are some kinds of work where "elbow-grease" is required. I have been shown men who appeared to be doing real work, but who were not applying that "elbow-grease" which was necessary for a paying result and so on.

Then, as to 2. I had to pave a large building with granolithic paving. When about half of it had been done by men thoroughly competent to lay it to the proper falls and to arrange and set out the channels for water the plasterers took it into their heads that they were the proper men to do this work, and told the builder that unless he allowed them to do it they would all leave the job. He had to comply, and the result is the work cost him more money and is inefficiently performed both as to falls and finish. A bricklayer was building a manhole to a drain the other day and was finishing the inside with a coat of Portland cement. Again the plasterers waited upon the

foreman and told him that unless they were allowed to do this little piece of Portland cement work they would all leave the job, and again the builder had to succumb. The constant interruptions on works because unionists will not work with non-unionists are well understood by all, and I myself have known of the losses incurred by builders because of the tyranny which one set of workmen exercise over another.

I could go on with a dozen instances of disgraceful behaviour on the part of the unionists and of their laziness and blunders, but perhaps I have said sufficient to give a small idea of what masters have to put up with from their workmen. I sincerely hope that the employers in the engineering trade will convey a lesson to engineers which will permeate through every trade in the country, and which is sure to lead ultimately to that welfare of our workmen which all desire, but which the workmen themselves are doing so much to injure and destroy.

BY-LAWS IN EASTBOURNE.

ON Monday last Messrs. Charles Peerless Dennis and Sydney Walter Winter, trading as C. P. Dennis & Co., Terminus Road, were summoned, says the *Sussex Daily News*, for proceeding with the erection of fourteen new buildings upon the Cavendish Bridge Estate without giving notice or submitting particulars as to the area, situation, character of buildings, &c., to the Town Council. The town clerk (Mr. H. West Fovargue) appeared in support of the prosecution, and Mr. Wintle, who represented the defendants, pleaded guilty to a technical breach of the by-laws, explaining that the buildings were not being proceeded with. What had been done was to lay the concrete foundation, upon which afterwards the houses were to be erected.

The Chairman regarded the proceedings of the defendants as a real and substantial breach of the by-laws.

Mr. Field, the building surveyor, said the plans had been received by him only that morning.

It was ultimately agreed, upon the defendants giving an undertaking not to do anything until the plans were passed by the Council, to adjourn the case for a month.

Arthur Blackman, builder, 40 Terminus Place, was also summoned for contravening the building by-laws by proceeding with the erection of cottages upon the Simmon's estate without first depositing complete plans and sections.

PRICE LIST AND ESTIMATES ON APPLICATION.

The defendant admitted the offence, but said that he thought the plans had been sent in ; it was a contract job.

The Town Clerk said this case was taken up as an example out of some half-dozen that had occurred. The estate plans had only just been approved of between the owners and the Town Council ; but notwithstanding this the defendant and others had proceeded to erect these buildings. The penalties, it was explained, to which the defendant and others in a similar position had rendered themselves liable to were 20*l.* for going on with the building ; a fine of 5*l.* for failing to deposit plans, and to a daily penalty.

The defendant said he quite understood, after receiving the warning letter from the Town Council, that he was to take the risk of what he was doing.

The Chairman : So that if the plans are disapproved you know that you may have to pull every brick down again ?

The defendant : Exactly.

Mr. Field said it was the fact that the levels of the buildings in question were faulty, that the intercepting drains were above the level of the ground.

The Chairman observed that in preceding cases of this kind, while the buildings which they had inspected were very faulty ones, they had hesitated to deal with them because the work had been done, but if the regulations of the local authorities were wilfully and deliberately disregarded, as they were in this case, and the builder snapped his fingers and said he was quite prepared to take the risk, it became necessary to make an example ; otherwise they would have no local control whatever over the action of the builders. The whole town was affected. They would impose the full penalty of 5*l.*, to include costs.

The defendant : Is it quite fair to make me a victim for what other builders have been doing for years ?

The Chairman : The bench were unanimous in taking this view. Your conduct has been so wilful and so deliberate.

The defendant : It is the case with all the others.

The Chairman : Well, it must be put a stop to. It is a pity that the penalty should fall upon one man, but it must be brought home to the builders.

THE Archaeological Society at Athens has decided to resume the works for the restoration and strengthening of the ruins of the Parthenon. The English company which is working the marble quarries at Pentelicos has offered for the purpose marble blocks of excellent quality and large size.

RESPONSIBILITIES OF DRAINAGE BOARDS.

ON the 5th inst. in the Irish Queen's Bench Division, before the Lord Chief Justice, the Lord Chief Baron, Mr. Justice O'Brien and Mr. Justice Johnson, judgment was given in the case of Bligh and others *v.* Rathangan River Drainage Board, which had been reargued during the present sittings. The plaintiffs, farmers residing in the vicinity of Allenwood and Robertstown, had brought actions against the Drainage Board to recover damages caused to their holdings and crops by a flood in July, 1894, owing, as they alleged, to the negligence of the defendants in cleaning and scouring the bed of the Rathangan River and its tributaries. The defendants denied their liability to cleanse the channel, and submitted that there was no commission or misfeasance on their part that gave the plaintiffs any right of action, as the Board had been authorised to construct certain drainage works by Act of Parliament, and, as it was admitted, the works were properly constructed. It was also relied on by the defendants that the plaintiffs, though resident within the district area, were not contributors to the maintenance of the works. The county court judge decided in favour of the defendants. Against this decision the plaintiffs had appealed, and Mr. Justice Johnson, before whom the appeal was heard, on the application of the defendants, stated a case for the opinion of the Divisional Court. Briefly what was brought out in evidence was as follows :—The Board had been constituted under the Drainage Acts, and they had obtained the permission of Parliament to make certain alterations in the Rathangan River. The engineer to the Board had submitted the necessary scheme to the Board of Works, and a provisional order was made sanctioning the scheme, and by reference to the provisional order it was clearly apparent that a greater body of water had been brought into the district than originally had been, and on this account it was contended on behalf of the plaintiffs that the defendants were liable in an action for damages for omitting to keep the river clean. It was part of the duty of the defendants to maintain as well as alter the bed of the river. It was also proved that the plaintiffs had suffered material damage by reason of the river not having been so maintained and kept clean, and that when the heavy rains came their lands had been seriously flooded.

The Divisional Court were now unanimously of opinion that the county court judge was wrong in his judgment and should have decided in favour of the plaintiffs, who should get their costs of the proceedings.

Messrs. W. B. SIMPSON & SONS, 99 St. Martin's Lane, W.C.

The Lord Chief Justice, in delivering judgment, said the case involved a question of very considerable importance. That question was what was the liability (if any) to riparian proprietors and occupiers along the Rathangan River for damage caused to them by the Rathangan Drainage Board omitting to scour and cleanse the main artery of their drainage district. It had been found in the case that the river had not been scoured for some years, and that if it had been scoured and cleansed the damage which was done would not have occurred. The plaintiff in the test case was not a proprietor or lessee, but he occupied lands held under a parole tenancy adjacent to the banks of the river. The main contention on the part of the defendant Board was based on the distinction between the consequences which attached to acts of commission and acts of omission. It was alleged on their behalf that the damage complained of arose from their omitting to scour and cleanse the river, and although they should be held responsible for misfeasance or acts of commission, no responsibility attached to them for mere nonfeasance. No doubt the distinction between acts of commission and nonfeasance formed the basis of the decision in many cases cited at the Bar, and the question was whether this case fell within that category of the cases where mere nonfeasance was held to establish a ground of immunity. They (their lordships) thought it did not fall within that category, and on the ground that in this particular case the common law right of the riparian proprietors and occupiers along the banks of the Rathangan River were interfered with and infringed by the acts of the defendant Board. No doubt the Board had a statutable justification for the original works, but nevertheless these works, though authorised, interfered with the common law rights of the plaintiffs, because the river having been diverted and straightened and widened there was an increased volume of water at an increased velocity sent down through an altered channel. It appeared to him that the question in the case was whether the defendants had justification under the Act of Parliament. They would, in his opinion, have a justification if their powers were limited to works of original construction merely, but in his judgment they had no such justification, as it was plain from the section of the Act they were to maintain as well as to construct, and had for this purpose an express statutable power to enter and scour and clean the stream, and to raise the necessary funds, which indeed by the statute they were not only empowered, but required to raise. This, he thought, was the principle of the decision in the well-known case of *Gedden v. the Proprietors of the Bann Reservoir*. His lord-

ship here read several reports from judgments of the law lords, and in conclusion said in the case now before them there was an original common law right infringed. There was power to enter and cleanse, and in the words of Lord Chief Justice Blackburn, there was a neglect to make a reasonable use of the powers given to them by statute. The defendant Board, in his opinion, was accordingly responsible, and the decision of the learned county court judge should be reversed.

LONDON WORKS COMMITTEE.

At the meeting of the London County Council on the 9th inst., the fire brigade committee reported that four tenders had been received for enlarging and altering the Hampstead Fire Station, the lowest of which exceeded the architect's estimate of 4,170*l.* by 785*l.* The work had been offered in July to the Works Department, but the manager was not satisfied with the amount of the estimate. The firm submitting the lowest tender stated in their tender that if the work were carried out under the general conditions for building contracts agreed upon by the Royal Institute of British Architects and the Builders' Society, and adopted by the Central Association of Master Builders of London, the firm's tender would be reduced 5 per cent. The firm also added that it would require the clause in the form of contract as to payment altered. The architect stated that 100*l.* of the difference was attributable to the rise in labourer's wages which took place in June last, but, having looked over the bills of quantities of the lowest tenderer, he found that some items were priced at rates which, in his opinion, were excessive. The committee recommended that neither of the tenders should be entertained.

Mr. M'Kinnon Wood moved an amendment to refer the matter back for further consideration, to include the causes which had led to the tenders exceeding the estimate by so large a sum. He said that in the past considerable complaint had been made against the works committee of quarrelling with the estimates. The present case went far to justify the action of the committee. They said the estimate in the present case was too low, and that had been confirmed by the contractors.

Mr. White said that his complaint against the works committee had been that it had accepted work at too low a cost. The reason that contractors were shy of tendering for the Council's work was that the conditions imposed by the Council

were very onerous. This fact also probably accounted for the tenders in this case being so large.

After further discussion the amendment was agreed to.

Mr. White drew attention to a paragraph in the report of the main drainage committee, in which the Council was asked to sanction an additional expenditure of 343*l.* for the repainting of the middle level sewer aqueduct over the Metropolitan Railway at Farringdon Road. He said that the work was carried out by the Works Department under a schedule of prices, the value amounting to 375*l.*; whilst the actual cost of the work had been 718*l.* If this work had been given to a contractor this excess would never have occurred; and the ratepayers would not now be saddled with this loss. He moved as an amendment that the excess expenditure should not be sanctioned until the finance sub-committee on works had reported on the details of the expenditure.

Mr. Fletcher seconded the amendment, which was agreed to.

The Earl of Hardwicke moved, "That the finance committee be requested to furnish to the Council before its second meeting in the month of December next the estimated and actual cost of all works completed up to September 30 last as reported to the executive committees; together with a return of works refused by the Works Department for which tenders were afterwards received from contractors, in continuation of the return presented on May 11 of this year."

Mr. Whitmore, M.P., seconded.

The resolution was agreed to with several verbal additions to the effect that returns should also be presented of the lowest tenders accepted for works not offered to the Works Department during the same period and the amount of the architect's estimates.

FISSURE IN A RESERVOIR.

A REPORT has been presented to the District Council of Castleford by Mr. Malcolm Paterson, M.Inst.C.E., on the state of their service tank on Red Hill, which is almost without a precedent in this country. A huge fissure extends across the entire surface of the bottom, 2 feet to 5 feet in width, and about 28 feet deep. This was laid bare some months ago, after the sudden disappearance of the contents of the tank, when the concrete bottom was partly removed. The reservoir site is on the Permian formation, the strata consisting of magnesien limestone, lying in a compact sand bed almost indurated to rock.

This rock yields the best moulder's sand, and has been excavated by mining for many generations in long galleries with supports and adit entrances. The workings extend for miles, and have been proved to approach within a few feet of the reservoir, and probably extend below it on the north side. By exposure to air and the infiltration of water they have gradually crumbled and fissured, causing leakages from the tank, which in their turn have accelerated the waste and the subsidence, and have caused the ruin of the tank. An inspection of these workings was necessary, though attended by danger from loose rock in the roof. In Mr. Paterson's report a previous proposal to buttress the north side by a retaining wall, arched on plan, is set aside as a futile and hazardous operation. Instead of this, he proposes to construct a new reservoir, holding 1,250,000 gallons, on a new site on adjacent ground to the west of the present tank, which appears to be the only suitable site not honeycombed by the sand workings; but even here he considers that five or six borings, not less than 50 feet deep, are indispensable to prove the ground. The present population of Castleford is 17,000, having increased from 6,271 in 1871. The cost of the new reservoir, if open, is estimated at 3,250*l.*, or if covered at 4,700*l.*

NEW SANATORIUM AT HASTINGS.

A MEMORIAL-STONE has been laid at the new Sanatorium buildings just approaching completion at Ore and adjoining the building at present in use at Cackle Street, Hastings. The building and road have cost about 12,000*l.* and other accessories about another 2,000*l.* The plans were prepared by the borough engineer (Mr. P. H. Palmer), and the buildings are arranged on the pavilion principle. Mr. Peter Jenkins, of St. Leonards, is the contractor, and Mr. Bouley clerk of the works. Altogether there are eight buildings—four buildings furnish the hospital accommodation, two being isolation wards. There is accommodation for forty-six inmates. No small-pox cases are to be received, as in the event of such occurring the Corporation possess the Ore Villa farm Sanatorium. The heating is by Messrs. Messenger, Loughborough and the stoves have been supplied by Messrs. Shorland, Manchester. The buildings were inspected by the company. The ceremonial of laying the memorial-stone was performed by the Mayor.

HOME GRANITE v. FOREIGN STONES.

THE importation of foreign stones for the purpose of polishing has been on the increase for some years, and as they are sent off from Aberdeen when finished they have gradually been accepted in England and in other countries as Aberdeenshire grey or blue granites, thus giving a bad name to pure and true granites. It is therefore of importance to have a comprehensive report by such an authority as Professor James Geikie, D.C.L., LL.D.; F.R.S., Professor of Geology in the University of Edinburgh. Some specimens were sent to him, including "Labradorite, Swedish"; "Bon-accord, Swedish"; "Finland, Russia"; "Victoria Grey, Swedish"; and also a specimen from the deepest level in Rubislaw Granite Quarries, Aberdeen. With regard to the foreign specimens the report says:—"Some can be called granites, others not even that, and not one of them is a true or normal granite."

Professor Geikie reports on "Rubislaw":—"This rock is a true granite, and is the only true or normal granite submitted to me. This is one of the most durable kinds of granite."

The following is the text of Professor Geikie's report:—

University of Edinburgh: July 14, 1897.

Sirs,—Having now examined the several specimens of crystalline rocks you put into my hand, I am able to certify their petrographical character as follows:—

I. Specimen labelled "Labradorite, Swedish."

This is a greyish green and very coarsely crystalline rock. To the naked eye it seems to consist chiefly of large feldspars, showing some play of colours, with a subordinate proportion of dark mica and pyroxene.

Under the microscope the feldspars prove to be the varieties known to mineralogists as anorthoclase or cryptoperthite, that is, mixtures of albite and orthoclase.

The other ingredients are dark greyish green augite with diallage structure, deep brown biotite (mica), magnetite and apatite, which appears in relatively large crystals. This rock belongs to the class of augite-syenites (known to geologists as laurvikites), which are well developed in Southern Norway. The rocks referred to are somewhat variable in composition, containing often zircon, occasionally olivine and nepheline, and less commonly quartz.

II. Specimen labelled "Bon-Accord, Swedish."

This rock is an olivine-gabbro. Its constituent minerals are plagioclase feldspar, augite (diallage) and olivine, with a small proportion of black mica and magnetite. The plagioclase occurs in fairly well-formed crystals, which are occasionally enclosed in the augite,

thus showing a tendency to what is known as the ophitic structure so commonly seen in the rock called diabase. The olivine is very fresh and rather abundant. The black mica (biotite) mostly occurs in the form of scales around the magnetite. Gabbros of this character occur at Elfdalen in Sweden.

III. Specimen labelled "Finland, Russia."

This rock is a fine hornblende-granite. In the hand-specimen it has a schistose aspect, a structure which is not seen under the microscope. The chief mineral constituents are hornblende, biotite, orthoclase, plagioclase and quartz.

The accessory and minor ingredients are apatite, magnetite, zircon and sphene, the last-named being fairly common. The hornblende is green and the biotite is dark brown. Both occur in small crystals, usually associated and often well formed. The orthoclase is very fresh and abundant. Plagioclase is not very common. Quartz occurs in fair quantity. Epidote (a secondary mineral or product of decomposition) is present.

IV. Specimen labelled "Victoria Grey, Swedish."

This rock is quite a normal granite, consisting of orthoclase, biotite and quartz. Along with these occur a little microcline and micropegmatite, apatite and zircon. The last-named is enclosed in the biotite, and is surrounded by black halos.

V. Specimen labelled "Rubislaw."

This rock is a true granite. It contains white and black micas (Muscovite and biotite), of which the latter is the more abundant, together with feldspars and quartz. Of the feldspars, microcline is the most prevalent, but plagioclase occurs in fair quantity. Fine needles of rutile are seen in the quartz. Other accessory ingredients sparingly present are zircon, apatite and magnetite. This is one of the most durable kinds of granite.

Igneous crystalline rocks are usually classified as follows:—
1. Acid rocks, with 65–80 per cent. of silica. 2. Intermediate rocks, with 55–70 per cent. of silica. 3. Basic rocks, with 45–60 per cent. of silica. 4. Ultra-basic rocks, with 35–50 per cent. of silica.

Of the specimens of rocks submitted to me—

No. I., "Labradorite, Swedish," belongs to the intermediate group, and can in no sense be described as a granite.

No. II., "Bon-Accord, Swedish," is one of the basic group, and has equally no title to be called granite.

Nos. III. ("Finland, Russia"), IV. ("Victoria Grey, Swedish"), and V. ("Rubislaw") all belong to the acid group, the most basic of the three being the hornblende-granite, No. III.

The percentage of silica in IV. and V. is probably much the same. Nos. III. and IV. are granites—that is, biotite-granites—the only true or normal granite being No. V. ("Rubislaw").

Yours faithfully,

(Signed) JAMES GEIKIE, LL.D., D.C.L., F.R.S.

THE COST OF AN INDIAN EARTHQUAKE.

THE official report from the secretary to the Chief Commissioner of Assam on the earthquake of June 12 last, which resulted in the loss of 1,542 lives and the destruction of an enormous quantity of property, has arrived. The cost of repairing damages in the Public Works Department alone is estimated at more than 35 lacs of rupees, or, to put it moderately, over one quarter of a million pounds sterling. These figures do not include the cost of damage to local communications chargeable to municipalities and local boards or departmental expenditure not borne by the Public Works Department. In the circumstances, the Chief Commissioner is applying for a grant from Imperial revenues to assist the administration to recover from the effects of the earthquake. "Here," says Professor Milne, "we have a danger threatening life and capital which can only be avoided by the acceleration of engineering operations. With regard to the proposals that the various headquarters of the Assam administration shall be shifted to more favourable sites, the interference which such a step would cause to public and private interests makes it desirable that the effects of earthquakes in the future should be met, not by escape to localities where movements might be less, but by changes in the methods of construction. During late years Japan has suffered from earthquake movements probably more severe in the ratio of nearly five to three than that which in June last created so much destruction in Assam. . . . Profiting by experience and guided by experiment, Japanese engineers and their European colleagues have gradually departed from stereotyped methods of construction, with the result that structures of the new type, whether they are ordinary dwellings or other works, have so far remained standing, whilst what is old is slowly disappearing. The fact that the Japanese Government annually votes from 1,000% to 5,000% to assist a committee in investigations which may result in modifying earthquake effects, has a bureau controlling the seismic survey of its country, and has appointed a professor of seismology at its University (at which all students of engineering listen to some twenty or forty lectures on construction in earthquake countries, and by this time may have read the report of its trained seismologist, Dr. F. Omori, sent to Assam to note anything that might be of benefit to his own country), are strong testimonies that material benefits have already been obtained from the study of earthquakes. When we consider the British capital invested throughout the seismic regions of the world

and the money from time to time expended in the restoration of consular and other buildings, we must surely feel that the sooner we turn attention, if only to that which has already been done to mitigate the effects of earthquakes, the sooner will the loss of life and property which accompany such disasters be reduced."

THE LONDON SCHOOL BOARD AND THE AUCTIONEERS' INSTITUTE.

THE secretary of the Auctioneers' Institute, Mr. Charles Harris, has forwarded some correspondence which has passed between that body and the School Board for London with regard to the procedure in negotiations for the purchase of land by the School Board for London. In December last Mr. James F. Field, the president of the Institute, wrote to the clerk of the School Board calling attention to "the procedure now being adopted and known as a 'new rule,'" which, he says, appears to comprise the following points:—(a) The refusal to serve a notice to treat as an initial proceeding, as required by the Lands Clauses Act; (b) its use, when proposed to be served as a threat that the compulsory powers of the Board will be enforced; (c) the violation of the spirit of section 82 of the Lands Clauses Act and the practice under it by the refusal of the Board to pay surveyors' fees, except in exceptional cases; (d) the refusal by the Board to hear any explanation of a claim from the claimant's surveyor; and (e) their refusal to accept a practising surveyor as umpire in cases of disputed compensation. Mr. Field, in his letter, contends that if this "new rule" be acted upon and not published, nearly every surveyor in London would be put in a false position, for if a client told him his property was scheduled and inquired his terms for conducting the business, he would, in ignorance of the rule, reply that every public body paid the claimant's surveyor's fee if a settlement was arrived at. The council of the Institute desired to save surveyors being put in this false position. They therefore contended that the rule should be publicly announced.

On behalf of the works committee of the School Board, the clerk to the Board replied to this letter on April 6, 1897, and stated that there was no "new rule" in connection with the negotiations for the purchase of interest in sites. The committee declined to give any undertaking which might restrict their liberty as to their mode of procedure. With reference to the complaint that notices to treat were not always served as

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact it will waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION.

an initial proceeding, the committee held, on legal advice, that this need only be done before they could avail themselves, as against an unwilling vendor, of the machinery of the Act. On June 29, Mr. Field again wrote to the clerk to the Board, pointing out, in reference to his statement that there was no new rule, that the land surveyor to the Board, in a letter from him to Messrs. Saffery, Huntley & Son, had written of a "rule which had been come to not to pay surveyors' fees." Mr. Field said he was glad, however, to find that there was no new rule, and he apprehended that the Board's surveyor had been acting under a misapprehension. On July 7 the clerk of the Board wrote to Mr. Field refusing on behalf of the works committee to accept responsibility for the interpretation put on his previous letter. Writing again on August 30, Mr. Field pointed out that the rule was, and, if not altered, is that the board paid the vendor's surveyor's fees, yet the board's surveyor had written to a vendor that the board would not consent to do so, though later on he wrote that as the vendor was a trustee he had no doubt his committee would pay. If, therefore, there were no new rule, the board's surveyor ought not to have written as he did, and the fees which had been paid by claimants ought to be refunded by the board. On September 28 last the secretary to the institute again wrote, enclosing a letter from a member of the institute intimating that in a case in which he was concerned the board had added a proviso to the notice to treat that they would not pay the surveyor's fees. Up to the 28th inst. only official acknowledgments of the receipt of these last two letters had reached the Institute.

INSTITUTION OF JUNIOR ENGINEERS.

THIS Institution held the inaugural meeting of its seventeenth session on the 5th inst. at the Westminster Palace Hotel. Sir Alexander Binnie, the retiring president, was in the chair, and presented the Institution premium to Mr. W. R. Beckton for his paper on "The Protection of Buildings from Fire." Mr. H. B. Vorley moved and Mr. W. J. Hunter seconded a vote of thanks to Sir A. R. Binnie for the services rendered by him to the Institution during his year of office, and this was heartily accorded. Mr. John A. F. Aspinall, M.I.C.E., chief mechanical engineer to the Lancashire and Yorkshire Railway, was then introduced to the members as President for the ensuing session by Sir A. R. Binnie. Mr. Aspinall, who was warmly cheered,

delivered his presidential address, the subject of which was "Some Aspects of Railway Work." The greater part of the address dealt with matters of a technical nature, but the President, in the course of it, urged upon any young man who intended to learn the business of a railway engineer to make the best use of his powers of observation when he was in the workshop, so that he might store up a fund of useful information by the time he was fortunate enough to secure any position of responsibility. His experience had been that those young men who had in the first instance gone to one of the engineering schools and had afterwards gone into the workshop had generally begun at the wrong end. The tendency of the lad who went first of all to an engineering school and acquired some slight knowledge of what could be done upon a lathe or other simple tool was, when his time came to enter a mechanical engineering establishment, to assume he knew a great deal more than he actually did, and to give considerable offence to the workmen among whom he was placed, instead of setting himself patiently and quietly to acquire as much knowledge from them as he possibly could during the short time he would be in the shops. His view was that it was far better for a young man to enter the workshops for one or two years, and after that to go to one of the engineering schools, returning again to the workshops to finish his time. If that was done, he entered the engineering college with some appreciation of why he was learning the things which were put before him and a great deal more knowledge of human nature, and, he thought, set himself to learn different theoretical subjects with very much greater interest, because he had somewhat definite ideas of the way in which theory could be applied to practice.

ASSOCIATION OF SANITARY INSPECTORS.

THE quarterly meeting of the Association of Sanitary Inspectors of Carnarvonshire and the adjoining district was held at Portmadoc under the presidency of Dr. Fraser, medical officer of health. Mr. Morris Williams, Crickieth; Mr. John Geo. Jones and Mr. Robert Jones, Portmadoc, were elected members of the Association. Mr. Worrall (Penmaenmawr) proposed "That the objects of the Association would be best realised by amalgamating with the North-Western and Midland Sanitary Inspectors' Association, and that a committee be appointed to confer with the council and submit to the next meeting a basis of amalgamation." After a discussion Mr. Worrall agreed to

an amendment to simply appoint a committee. It was decided to hold the next meeting at Conway. Dr. Wm. Jones Morris read an excellent paper on "Sanitation," and Dr. Walter Williams made some admirable remarks with regard to "Diphtheria at Home," with diagrams. Mr. J. D. Lewis, Portmadoc, read a paper on house sanitation. He said nine-tenths of the poisoned atmosphere in towns and villages would be prevented by the proper sanitation of each house and its occupants. The poorest men and women should not lack healthy houses to live in, and it ought to be the care of the rich for their own sake if for no other reason, that the dwellings of the poor were made wholesome.

LONDON ASYLUM ACCOMMODATION.

THE asylums committee of the London County Council will shortly ask the Council to sanction a large expenditure for the provision of temporary buildings for the accommodation of female lunatic patients on the Horton Manor Estate, Epsom. It is on this estate that the Council is about to erect a permanent asylum, but as this cannot be finished before the end of the year 1900, it has become necessary, owing to the inadequacy of the vacancies occurring at the London asylums to meet the demands for recent cases of lunacy, to immediately provide further accommodation. The Bexley Heath Asylum, which is now being constructed, will not be finished until the beginning of 1899. Accommodation has been obtained for pressing cases at out-county asylums wherever it has been procurable, and the committee have just recently entered into a contract with Fisherton House, Salisbury, for the reception of 206 cases at a *per capita* cost of 19s. 3d. a week. The number of applications now outstanding is still very large and increases weekly, and the expeditious erection of buildings is a matter of extreme importance. The committee point out that the cost of maintenance of London patients in other institutions for lunatics is high, the rate at licensed houses ranging from 19s. 3d. to 2l. 2s. a week, and many of these institutions are so far distant from London that the visits of friends are thereby made prohibitive, and the cost to the guardians for removals is considerable. The primary cost of the proposed buildings, which are designed to be occupied for fifteen years and to accommodate 700 female patients, is 147,000l. This is equal to a charge of 5s. 5d. per head per week on the number of patients accommodated. Adding the weekly cost of maintenance in the London

asylums, namely, 9s. 11d., the whole weekly cost, including capital charges of lunatics in these buildings, would be about 15s. 4d. a week. The lowest charge for accommodation in licensed houses being as already stated, a saving of at least 4s. per week would be effected on every patient in the temporary buildings as compared with the cost of licensed houses, and this saving on 700 beds for a period of fifteen years represents a sum of over 100,000l. The whole of the works are to be completed in twelve months.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

Meshes from $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{3}{16}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

A MEETING of the sub-committee appointed to consider the plans for the reconstruction of certain portions of Glasgow Royal Infirmary was held on Friday last. Mr. James Thomson submitted block or ground plans, which were carefully examined by the committee, who are of opinion that they will meet the requirements of a modern hospital. It was agreed to submit the plans to the full executive committee.

NEW UNITED PRESBYTERIAN CHURCH IN EDINBURGH.

A NEW church in Fountainhall Road, Edinburgh, was opened yesterday, Thursday, with some pomp and circumstance. The new church has been built to the designs of Mr. Graham Fairley, architect, Edinburgh. It is a handsome building and adds considerably to the architectural features of the locality. Alike in plan and design, the edifice is an adaptation of the thirteenth-century Gothic architecture to the requirements of a modern church. Included in the plan are the traditional nave, aisles, transepts and chancel; and while the nave is wide in span the aisles are narrowed to the width of side passages. By means of this latter arrangement all the congregation can see the minister, whether at the lectern or in the pulpit. There is no gallery. The chancel, in which stands a communion table of oak, is reserved for the use of the elders; and the choir are accommodated in the east transept, where accommodation for the organ—driven by a 1 horse-power electric engine—is also found. So far as the exterior of the church is concerned, the design suggests that the architect has had in view the well-known front of Dunblane Cathedral—different proportions in width of front and of height, of course, necessitating a different treatment of details. Dignified simplicity of design—almost approaching to plainness—in the large and solid grouping, in contrast to the gaining of effect by smaller grouping and richer ornamentation, is the outstanding feature of the structure; and in order to secure a solidarity of appearance, as it were, from the very base, Mr. Fairley has placed a low parapet wall of stone in front of the church, and separating the ground from the footway, instead of an iron railing, which is usually adopted in such cases. Internally the building has an almost plain but at the same time a dignified and impressive appearance. The effect is in part due to the number of beautiful stained-glass windows, most of them gifts from members of the congregation. Two of these windows are of special interest in that they will serve to remind the congregation of its previous place of worship. They are the chancel windows, part of which was brought from the Infirmary Street building. One of them is a memorial in stained-glass to Dr. Bruce, the minister of the congregation from 1838 to 1882; the other is in memory of Mr. George Burn, who was an elder of the church from 1840 till 1893. The windows lighting the aisles are also in stained-glass. On the

east side these represent historical Old Testament characters, while on the west the representations are of New Testament figures. In the vestibule, in the west transept and in the clerestory of the nave—on the west gable of the building—are beautiful memorial windows, all designed so as to harmonise with the style of the building. Placed on the west side of the chancel, the pulpit—also the gift of a member—is of most artistic design. It is of Caen stone and red marble, and in the niches are figures of the Saviour and of the Apostles Paul and Peter. The desk is of polished brasswork. In the centre of the chancel is a lectern of hammered brasswork, and on the east side a handsome font of the same material as the pulpit—both gifts. The church will accommodate a congregation of six hundred. The seats are of pitch pine, stained in a dark green tint; and the roof is of open timber-work, also stained. Ample provision is made for the lighting of the building by means of electricity—the heating, again, being on the low-pressure system. Behind the chancel, with a cross passage of communication, are the halls and offices, which are very conveniently arranged. The large hall is a spacious, well-lighted apartment, giving accommodation for 200, and it, like the church, is furnished with an open timber roof. The building is valued at about 8,000*l*.

TRADE NOTE.

The burgh schools, St. Andrews, are being warmed and ventilated by means of Shorland's patent Manchester grates.

The Marquis of Ripon (chairman of the Ripon Board of Guardians) laid a foundation-stone on the 11th inst. in connection with the new infirmary in course of erection at the Ripon Union workhouse. The new building is estimated to cost 2,650*l*. It has an admirable position on the east side of the existing buildings, with a good view in the direction of Ripon railway station and the valley of the Ure. Including provision for nurses in the centre of the building, there will be accommodation on the ground and second floors for about forty persons. In addition to the sick wards for men and women, there are day and duty-rooms, foul wards, lying-in ward, with separate bathrooms and lavatories in each section. There will also be hot-water apparatus for heating the building.

VARIETIES.

THE new intermediate schools at Llanfyllin were formally opened on the 12th inst.

DAMAGE to the amount of 30,000*l*. resulted from a fire which broke out on the 11th inst. at Bishop Auckland in flour mills owned by Messrs. Appleton, French & Scragton.

TWO memorial windows of an heraldic character, and interesting from local associations, are being erected in Neilston parish church.

THE Archbishop of York has dedicated a chancel screen placed in the church of St. Michael and All Angels, Sheffield, to the memory of the late Mr. Wake, of Sheffield.

THE new church for the parish of St. George, Altrincham, has now been completed, and the act of dedication has been performed by the Bishop of Chester. Erected on the site of a church, built in 1799, the new church has cost 5,300*l*.

A TELEGRAM from Guayaquil states that the Peruvian town of Loreto, on the Amazon, has been destroyed by a hurricane. Only a few buildings are left standing, and there has been considerable loss of life.

THE contract for the national harbour at Dover has been settled, and Messrs. Pearson & Co.'s tender accepted. The amount of the tender, it is stated, was between three and a half and four millions.

A NEW convalescent home in connection with the Manchester Children's Hospital, which has been built and equipped at St. Anne's-on-Sea by Sir William Agnew, Bart., president of the hospital, has been formally opened and presented to the board of governors and trustees.

ON Saturday last Lord Lilford opened the new Church schools at Tarleton erected to meet the requirements of the Education Department and of a growing district. The estimated total cost of the buildings and site was 2,700*l*.

SIR H. HARBEN, chairman of the Hampstead Vestry, opened on the 10th inst. a new central public library which he has erected for Hampstead at a cost of 5,000*l*. on a site purchased out of the rate raised under the Public Libraries Act.

THE Archbishop of York recently attended the opening ceremony of a new Church mission-room at Millhouses, near Sheffield. The building, the site of which was given by Mr. Wilson Mappin, will accommodate 250 persons, and has been erected at a cost of 2,000*l*.

NO little excitement was occasioned in Newgate Street on the 15th inst. by the discovery that fire had broken out in Christ's Hospital. On examination it was found that the roof of the west wing had taken fire through a defect in the flue, and some 12 feet by 10 feet of the roof was involved; but the firemen effectually overcame the mischief before it could extend to the building underneath.

THE Great Northern Railway Company's engineers on Sunday last performed a remarkable feat in reconstructing the old iron bridge south of Hatfield, and over which run four lines of railway. Traffic was temporarily suspended, and with every necessary appliance in readiness the old bridge was removed and replaced by a new iron-girder bridge, the work being accomplished in about fifty minutes.

THE Painters' Company offer a Travelling Studentship of 50*l*. for the encouragement of the study of decoration. The studentship is open to competition by students between the ages of twenty and twenty-five in any recognised school of art or other institution devoted to the study of applied art in any form, and situate within the limit of the larger Metropolitan postal area.

THE Palace Theatre is still crowded nightly, and the programme is well up to Mr. Charles Morton's well-known high standard of excellence. Undoubtedly the feature of the evening is the biography of a ride on the engine of an express train, and the effect of this is as singular as interesting. Nothing is seen of the train, but the line and the surrounding country approaches the audience at express pace. Presently a tunnel is seen in the distance; this approaches, is entered, and after a time the darkness is broken by a point of light far ahead; this in its turn grows and grows until suddenly sunshine and scenery

are again entered. The illusion is excellent, and should on no account be missed. Other excellent turns are Zæo in her charming studies of light and grace, the Ibrahim troupe of Arabs, and many of the old favourites.

THE eight side windows in Bothwell parish church have been entirely renewed. The centre of them has been filled with variously tinted cathedral glass, the borders being alternately decorated with hand-painted leaves and flowers. The two end windows have been filled with painted glass, similar in character and design to the window presented to the church several years ago. In one of them the Old Testament types of the Israelites gathering manna in the wilderness, Moses striking the rock, the brazen serpent, and the scapegoat are represented; and in the other the following incidents in the New Testament, taken from the Acts of the Apostles, viz.:—Peter and John healing the lame man, the martyrdom of Stephen, the setting apart of Paul and Barnabas to preach the gospel to the Gentiles, and Paul preaching at Athens. The grouping is excellently conceived and very successfully carried out. The colouring is rich and varied, but chaste and fitting in tone.

A MONUMENT has been erected by Her Majesty in Crathie Churchyard over the resting-place of the late Mrs. Macdonald. The tombstone consists of two massive blocks of red Peterhead granite, on the top of which is carved an interlaced Celtic cross, while the base bears the following inscription in raised polished letters:—"This stone is placed by Queen Victoria in grateful and affectionate remembrance of Annie Macdonald, daughter of William Mitchell, of Clachanturn, and widow of John Macdonald. She was in the Queen's service for forty-one years, and during thirty-one years was Wardrobe Maid, and the faithful servant and devoted friend to the Queen, by whom her loss is deeply deplored. She was born at Carn na Cuimhne, January 3, 1832, and died at Clachanturn, July 4, 1897, beloved and mourned by all who knew her."

NEW school premises, which have been erected at a cost of 4,000*l*., in connection with St. Mark's parish church, Westland Road, Dublin, were opened on the 10th inst. by His Grace the Archbishop of Dublin. The new school buildings consist of boys', girls' and infants' schools, separate lavatories in connection with each school, classrooms and a kitchen, in which cooking and laundry lessons will be given to the female pupils. The old school has been converted into a parochial hall, and a large playground at the rear of the schools has been secured for the scholars.

ELECTRIC NOTES.

MR. F. J. WARDEN-STEVENS has been appointed the consulting engineer to the Smethwick Council in connection with the electricity supply scheme for the town, and to render the technical assistance necessary for obtaining the provisional order. The gasworks are owned by the Council, and they are considering the erection of refuse-destroyers. The site suggested for the electricity supply works adjoins the proposed site for the refuse-destroyers. Mr. F. J. Warden-Stevens has also been retained as the expert to advise the Oldbury Council in the question of electric lighting and power supply for the town. The Council owns the gasworks, and the site suggested for the electric supply works adjoins. Mr. Warden-Stevens has inspected the district, and the streets in which mains will be laid to commence have been settled.

THE General Electric Company of London and Manchester have added another branch to their business at 9 William Street, Dublin. The branch is under the management of Mr. Fletcher, who has had some years' experience with the company in London.

A COMPANY is being promoted in Musselburgh whose object will be to produce an electric light supply for the town. Water power will be obtained from the mill lade which runs through the burgh. The promoters are confident of success and of their ability to compete with the local gas company, which supplies gas at 3s. 9d. per 1,000 cubic feet. The gas company paid a 10 per cent. dividend on last year's operations, and shares, which are privately transferred, are seldom on the public market. The gas consumers consider the charge too high.

No less than seven local authorities have signified their intention to make application to the Board of Trade, under the Electric Lighting Acts of 1882 and 1888, for provisional orders to supply electricity for public and private purposes. These authorities are the Urban District Council of Barnes, the vestry of the parish of Bermondsey, the Corporation of Maidenhead, the Urban District Council of Willesden, the Urban District Council of East Ham, the Urban District Council of Aldershot and the Corporation of St. Albans. In addition to these intimations Mr. James de Lara Cohen, of Acton, has given notice that he intends to apply to the Board of Trade for a provisional order to empower him to supply electricity for public and private purposes within the area known as the Friar's Place Estate, Acton.

PREMISES have been purchased adjoining the General Post Office in Prince's Street, Dublin, for the erection of a power station, which will be furnished with engines to generate power for working the pneumatic system of transmitting telegrams as well as for lighting the whole of the Post Office and the Returned Letter Office in Upper Sackville Street. The lighting arrangements are to include three arc lamps in the public office, three outside the Prince's Street side, three in front of the portico in Sackville Street, and three in Henry Street. These should brilliantly illuminate the buildings inside and outside. The numerous internal offices will also be lighted by the new generating plant, more than a dozen lights being required for the instrument-room and an equal number for the sorting-room, and so on in proportion for the other departments. The Returned Letter Office in Sackville Street will be lighted by the same plant internally and externally. This plant will include a couple of boilers to deliver 200 horse-power, two pneumatic engines of 30 horse-power for the pneumatic transit of telegrams, and two hydraulic engines of 16 horse-power to supply hydraulic pressure for the lift. The whole of the General Post Office will be heated by a specially-designed apparatus; and the decision to erect a power station was, it is said, arrived at by the postal authorities in consequence of the Corporation being unable to give them the supply they required. This will be a distinct loss to the rates of the city.

BUILDING AND BUILDERS.

It is proposed to erect a new church in the St. Andrew's parish of Bradford.

At a meeting of the Nigg (Aberdeen) Parish Council, plans of a new hall, to be built at the junction of the Stonehaven and Cove Roads, were approved.

THE foundation-stone of a new billiard-room in connection with the Mechanics' Institute, Guisborough, was laid on the 9th inst. The contract for the works amounts to 595*l.* 12*s.* 10*d.*

PLANS were submitted at the Wetherby (Leeds) District Council meeting on the 11th inst. for thirteen new houses in Wetherby, where there is a great demand for them at present.

NEW theatres are springing up in all directions with quite unexampled celerity. Thus we are informed that the works

committee of the Paddington Vestry have approved amended plans for the erection of a theatre on the site of Nos. 212 to 220 Harrow Road. Having regard to the associations of Mrs. Sarah Siddons with Paddington, it is suggested that the new playhouse should be named "The Siddons Theatre." And that the plans of the new Coronet Theatre, Notting Hill Gate, have received the final approval of the County Council. Mr. W. G. R. Sprague is the architect of this theatre, which will occupy a site in High Street, Notting Hill Gate, open on three sides, having frontages to High Street, Johnson Street and Uxbridge Street. The frontage is to be entirely of white Portland stone. The audience will enter to the better part of the house direct from the High Street. The house is to be on the two-tier system, and is without a single column, the construction throughout being of concrete and steel and thoroughly fireproof. On the lowest level are stalls, pit-stalls and pit, the first circle consisting of dress circle and balcony, and second circle consisting of amphitheatre seats and gallery. The stage is some 40 feet deep, with a width of 65 feet and a height of 55 feet to grid. The decoration and furnishing throughout will be in Louis XVI. style, and the electric light will be utilised to the utmost. The theatre will be able to accommodate some 2,000 persons and will be ready for opening early next autumn. The cost will be about 25,000*l.*

SANITARY INSPECTORS' ASSOCIATION.

THE ninth meeting of the session of the North-Western and Midland Sanitary Inspectors' Association was held at the Royal Institution, Colquitt Street, Liverpool, on the 13th inst., Mr. William Urquhart, of Crewe, presiding. A large number of members and associates was elected, bringing up the total to 249. Mr. A. Kent, assistant sanitary inspector, Hanley, read a paper on "Disinfection," in the course of which he explained the various chemical methods employed, and laid stress upon the importance of the disinfectant being of the proper strength. He was of opinion that full power should be given to all sanitary authorities to have all places where infection had occurred, and also the bedding and clothing, thoroughly disinfected, without having to go through the formalities prescribed by the 128th section of the Public Health Act, 1875, and the 5th section of the Diseases Prevention Act, 1890. It

should also be made compulsory for all authorities to provide suitable disinfecting apparatus, while infected clothing should be removed weekly instead of being allowed to remain until the recovery of the patient.

GLASGOW CATHEDRAL.

ON Monday, the 15th inst., Mr. MacGregor Chalmers, president of the architectural section of the Philosophical Society, delivered the opening address of the session. There was a large attendance of members and friends. The subject of the address was "Notes taken from a Sketch of the History of Glasgow Cathedral," a sketch which the President intimated he had now in preparation for publication. Dealing first with the connection of Glasgow with the three great leaders in the Christianising of Scotland—St. Ninian, St. Columba and St. Mungo—a brief description was given of the early plans of church fabrics, both of the Roman and the Celtic types. The first church at Glasgow would naturally be of the Celtic type, and although its form had not influenced the designers of the succeeding structures, still the site of this early church had always been a dominant factor in the planning of all the later work. That our present cathedral stands on the site of St. Mungo's early church cannot be doubted, since the cross which the saint reared at his church existed even at the end of the twelfth century, and was then believed to have power to work miracles. Although St. Mungo's Church has disappeared, his well remains, and it is still possible to identify the spot where tradition says the saint deposited the corpse of Fregus, which he brought with him at the first that he might take possession of the land by a grave. Then we had, but no longer have, St. Mungo's bell, and gone, too, is St. Mungo's tree. Only a faint ray lightens the centuries between St. Mungo and the coming of David, Prince of Cumbria, who founded a cathedral anew, in conformity with the church system so closely associated with the name of St. Margaret. Nothing remains of the first church, which was dedicated in 1136. It may have been the centre aisle only of a small choir, terminating at the east end in a semicircular apse. The first bishop of whose work any part remains is Bishop Ingelram, who came to the see in 1164. A few loose fragments of this period are preserved in the chapter-house, but the only part of the structure is the small wall shaft near the west end.

THE FERRYBRIDGE FOUNDRY COY.
FERRYBRIDGE, YORKS.

of the south aisle of the lower church. This indicates the eastern limit of the old south aisle, and, with that, the general plan, and the probability that the side aisle was treated in an apsidal form. To the choir of this period Bishop Jocelin, who succeeded in 1175, began to add a great nave, and at a level which shows that by this time, at least, if not previously, a double choir was contemplated. The transitional character of Bishop Jocelin's nave is still preserved. A charter, granted to the bishop by King William the Lion, in 1190, explains why this great work was stopped—the choir was burned. Bishop Jocelin then rebuilt it entirely new, with the exception, evidently, of the single insignificant shaft referred to. Of this work considerable fragments remain in the north wall of the north aisle, and in the south aisle almost in its entirety, including the walls and vaulting. To this has to be added the carving of the capital of the old shaft, which had been left uncut, evidently, at the first. The mystery which has always been made to surround the preservation of this portion of the building vanishes when it is recognised that it remains, because it was never touched. When the choir was again completed, work was resumed on the nave, to be interrupted a second time, when Bishop William de Bondington began the erection of the present magnificent lower church and choir. The Chapel of the Four Altars at the east end of both churches was shown to be an interesting feature, carried out simultaneously at other places. The special features of the lower church were described, but a complete description and survey of this work is now prepared for the forthcoming volume of Transactions of the Archaeological Society. Attention was also drawn to the carving of the chapter-house door, which may have inspired the designer of the great rood screen to adorn it with the Seven Ages of Man. The two sarcophagi in the lower church, the fifteenth-century slab recently found in the churchyard, and the effigy at the east end of the lower church are the only Mediæval memorials of the dead. The sarcophagi were compared with the famous one at Govan, which was illustrated from the president's scale drawings, which appear in the first volume published by the Regality Club. The recent history of the effigy was narrated with the slight evidence upon which the present name rests. Had the fact been noted years ago that the feet had to be hewn away before the effigy could be placed in its present position, the conclusion would then have been inevitable that this is not the original site chosen for the effigy. The current opinion that the central

tower was the tower which was built at the end of the thirteenth century, destroyed at the beginning of the fifteenth century, and restored by Bishop Lauder, because that bishop's arms are carved upon the central tower, was shown to have had a blighting influence upon the study of the present nave. The thirteenth-century tower was the semi-detached north-western tower, destroyed needlessly about fifty years ago. The three sculptured stones which were taken from it at the point where the later work was joined to the early lower part are of early fifteenth-century workmanship. They are preserved in the chapter-house. Reserving any reference to the artists whose work adorns the cathedral, the following detached links were offered as a tantalising puzzle:—King Alexander II. married Marie de Coucy. Château de Coucy is the greatest Mediæval fortress in Europe, and was built in the thirteenth century. Bothwell Castle was directly copied from the Château de Coucy, and was built in the latter part of the thirteenth century. Robert de Coucy was one of the most famous architects in Europe, to whom we owe a great part of Rheims Cathedral, built in the thirteenth century. What was it brought Robert de Coucy here at the beginning of the fourteenth century? The lecture was illustrated by a large number of drawings and lantern photographs, and at the close a cordial vote of thanks was passed to the president.

DILATORY WORKMEN.

"A LONDON BUILDER" writes as follows to the *Times*, confirming the statements in a letter from "A London Architect" published last week:—

I have seen the letter in your issue of to-day signed "A London Architect," and I think it only fair to him that the statements which he has put forward should be either controverted or supported by the experience of a builder, and it is satisfactory to know that architects are taking notice of the manner in which the men engaged in building operations are fulfilling their duties and obligations to the general public, because after all they are the employers of the workmen, architects and builders being only intermediaries, and it is some consolation to the builder to know that the undue increase of cost of all building works will be placed to the account of the parties who are the cause of it, and not put down to the credit or discredit of the grasping employer.

147 STRAND, LONDON, W.C.

So far from your correspondent having underrated the case against the workmen I am quite certain it is otherwise, and I am sure the experience of other builders will confirm what I am about to submit, and that is, that on many jobs in London at the present time the bricklayers do not lay 450 bricks per day nor half that number, and I am not now referring to glazed bricks, or any special or expensive kinds of bricks, but ordinary common stocks or like quality.

I do not suggest that this method of fulfilling their obligations is confined to the trades mentioned, but it is general, and the men do credit to their teachers, if not to themselves. It is not many years since they were told openly, either in Trafalgar Square or Hyde Park, at a meeting to consider the question of the number of unemployed and the remedy for it, "You, each of you, do half the work you are doing at the present time, and there will be work for two where there is now only work for one."

It will be asked, What can this have to do with trade unionism? Well, in reply to this question the answer is that such a temporary violation of economic law can only be effected by organisation on the part of the violators; individual effort would be powerless, but the adoption of the sentimental suggestion by the leaders of a powerful organisation renders the trial of the experiment possible.

The foregoing observation applies with equal force to the other illustrations given by your correspondent of the numberless ways in which an employer of labour is molested and interfered with in the conduct of his business, and the absurd contentions put forward as to which and whose particular right and province it is to perform what in many instances are trivial and unimportant operations.

The employers in the present dispute have made enormous sacrifices in contending for the principles that :—

1. Labour is entitled to be paid for at market rates and, in view of the severe competitive "free trade" under which they obtain their orders, at a rate which will enable them to successfully compete with their competitors, and not on any sentimental standard rates which may be adopted or put forward by the men who run trade organisations, and in very many instances could not possibly keep a job where competitive merit came into play or existed. For, after all is said, the question of hours in the present dispute is a question of wages, nine hours' pay for eight hours' work.

2. That the employer is to determine in what way he should conduct his own business and utilise the machinery and

appliances which he has expended his capital on for the purpose.

It is difficult to see how the intervention of third parties can aid the permanent settlement of a question or questions where both sides fully realise and comprehend all the points involved, and where the only solution is the surrender or abandonment of the position which has been taken up.

In this instance the employers at any rate recognise that the intervention of third parties can mean only the unsatisfactory method of "auctioneers' equity," and they are not prepared to crown their eighteen weeks of sacrifice with such a miserable result.

If this conflict results in a demonstration that there are economic laws which, as other natural laws, must be regarded and not violated, however great the sacrifices may be which have been made by both the parties, they will not have been made in vain if the principle is brought home to the minds of others engaged in industrial operations before they enter into a similar conflict.

METROPOLITAN WATER SUPPLY.

ON Tuesday, the 16th inst., at the half-yearly meeting of the West Middlesex Waterworks Company, the chairman, Mr. E. Boulnois, M.P., referred to the proposals of the London County Council concerning the water supply of the Metropolis. He said that at the time of the lamentable outbreak of typhoid fever at Maidstone there were some who endeavoured to create an alarm in the public mind, hinting that there might be an analogy between the water supplied by the London companies and that supplied by the Maidstone Water Company. There was, however, no analogy. London received its water after the most effective system of storage and filtration, and the people of Maidstone received their water, not from the river, as they did in London, but from springs, which were tapped before they reached the river. It was, therefore, simply ridiculous to suggest that there could be any parallel between the supply of water at one place and the other. Notwithstanding this, and the full knowledge of all the circumstances, the Progressive party in the London County Council had endeavoured to unhinge the public mind as to the purity of the water they received from the water companies, and suggested that there was a parallel between the two supplies. In consequence of this they had decided to relegate to one of their committees an investigation into the condition of the water supply. The

London companies were getting used to inquiries and investigations; they were pretty well used to Royal Commissions and to other committees, and they generally came out with an enhanced reputation when they left these committees or investigations. If the so-called investigation by the London County Council was likely to be an impartial one he should have no fear whatever, and should unhesitatingly say that they had every reason to be satisfied that an investigation should be made if there was any doubt in the public mind as to the purity of the water supplied by the companies. But they knew perfectly well that the investigation would be a one-sided and not an impartial one. The engineer of the London County Council, Sir Alexander Binnie—who, of course, would be one of their principal witnesses on the investigation—had publicly declared that London water was no better than diluted sewage. Against this very wild assertion they had the testimony of such men as Sir Archibald Geikie, Mr. James Mansergh, Sir William Crookes, Sir E. Frankland, Sir G. Bruce, Professor Dewar, Dr. Ogle, and last, but by no means least, the Council's own late chemist, Mr. Dibdin, who had declared publicly the excellence of the water supply of the London companies. He (the speaker) thought the public would be more inclined to place confidence in the testimony and evidence of experienced men like those he had named than rely on the opinion of Sir Alexander Binnie and Mr. Idris. As a matter of fact, London was the only place where the inhabitants were treated to an inspection and analysis by the Government as regarded their water supply. The examination by the Government inspector took place frequently, and he had to report to the Local Government Board from time to time as to the quality of the water. Moreover, the water companies themselves, so anxious were they that any impurity that might exist in the water should be detected, arranged for an examination by two independent gentlemen—Professor Dewar and Sir William Crookes. The last report of those two gentlemen was dated the 10th inst., and in it they said, "Of the 182 samples examined during the month all were found to be clear, bright and well filtered;" and they went on to say that "the filtration and settling appliances of all the companies have been in a high state of efficiency during the past month. The water of every company has been specially tested for pathogenic organisms, but with negative results." He did not know that they could have any higher testimony than that; and this examination was not a fitful one, but was made every day throughout the month, except, of course, on Sundays. He

thought that the public would rest satisfied in their own minds that there was no analogy between the water supply given at Maidstone and that given in London; and he was sure they would be satisfied that the department of the Government which was responsible for the public health was taking every precaution to insure the purity of the water, and that the companies themselves were not behindhand in the matter. The Royal Commission to which reference was made in the last report, and over which Viscount Llandaff was to preside, would hold their first sitting next Monday, and it was their intention to offer to the commission every facility, and to give all the information in their power, in order to help them to carry on the investigation which Parliament had called upon them to make. During the past six months the directors had endeavoured to safeguard and protect the proprietors' interests, and although, for the moment, there was apparently a lull in the direct attacks which were made upon the water companies, yet they would be none the less watchful and none the less determined in guarding their valuable property. In answer to a question, the chairman stated that, as far as he knew, the London County Council had no intention of applying in the next session of Parliament for power to purchase the water companies' undertakings. It would be the first session in which the companies had been let alone for a considerable time. They had reason to be grateful for the respite, but he could not prophesy whether the County Council would pursue their policy thereafter. It was natural that they should await the result of the investigation which was to be made by the Royal Commission as to whether the purchase of the companies' undertakings would be beneficial to the ratepayers or not.

AN IRISH LUNATIC ASYLUM.

At the last monthly meeting of the Governors of the Omagh District Lunatic Asylum two important communications were read from the Board of Control relative to the unsanitary condition of the institution, which, it was alleged, gave rise to disease amongst the inmates.

The report made by Dr. O'Farrell, Inspector of Lunatics and Commissioner of Control, was to the effect that he had visited the asylum on the 7th and 8th ult., and in consequence of the serious condition of ill-health prevailing among the patients he again visited the institution on the 19th ult.,

accompanied by his colleague, Dr. Courtney, and Mr. Ussher Roberts, the consulting architect of the Board of Control, and they made a careful inspection of the works in progress. On this occasion they met some of the governors in conference, and also the architect responsible for the carrying out of the works in connection with the alterations and additions to the house. It was impossible for him not to express regret at the slow progress of these structural works, commenced so far back as July 1895, and which when completed, by increasing the accommodation, would relieve the overcrowding and permit of many improvements in the classification and treatment of the patients. It had been stated that the building had been retarded by strikes. Considerable progress had now been made with the remodelling of the drainage, and some of the sanitary annexes were now available for the use of the patients. But greater efforts should, in his opinion, having regard to all the circumstances of the case, have been made to remedy defects in connection with the old system of drainage and sanitary appliances which were to be removed on the completion of the new works; and as the continuance of serious illness called fresh attention to these defects, which the Board of Control and the resident medical superintendent had so often alluded to in the past, the Board of Control had considered it necessary to obtain the opinion of a sanitary engineering expert as to the efficiency of the new drainage works, and how the unsanitary conditions which had proved such a serious danger to the institution could be most promptly dealt with. In fairness to the architect he wished to state that in his opinion the new system of drainage devised by him had been carefully thought out, and was likely to prove in every way successful.

Mr. W. Kaye Parry, C.E., reported also having visited the asylum on several occasions in October. He stated that the existing drainage plans were found to be in many respects incomplete and unreliable, no doubt owing to the very large number of successive alterations. In regard to water in one of the tanks, which was not very clean, the analysis would seem to show that the water was quite unfit for drinking, and it was not a little remarkable that this water supplied the divisions in which by far the largest number of cases occurred, and that water had been condemned by the analyst in the most emphatic terms. In another tank he found the water to be in an exceedingly dirty condition. He was of opinion that the evidence appeared to point to the imperfect and unsuitable arrangements for water storage, and the want of attention to the

cleanliness of the water tanks, as the most probable and immediate causes of the epidemic of typhoid fever which was stated to have occurred, although the defects in the old drains might be regarded as one of the predisposing factors.

The governors regarded the reports as disclosing a very serious state of affairs, and so exhaustive and important that they could not deal with them that day. A committee was appointed to consider the reports, and it was also ordered that they should be printed and circulated among the governors, the recommendations of the committee to be considered at the January meeting.

THE NEW LINE TO LONDON.

THREE years ago, writes a special correspondent of the *Leeds Mercury*, the Countess of Wharnclyffe cut the first sod of the new line to London at Alpha Road, St. John's Wood, which will afford the Great Central Railway Company—until recently known as the Manchester, Sheffield and Lincolnshire Company—-independent access to the Metropolis. The construction of the line was let in six sections, one of the conditions in each case being that the work should be completed in two and a half years. The undertaking has proved a more formidable one than had been anticipated, and although it has been vigorously pushed forward, its completion will probably not be realised until July or August of next year. The endeavours of the directors to fulfil the long-deferred desire of their late chairman, Sir Edward Watkin, "to land the old Sheffield in London," have been remarkable for a persistency scarcely equalled in the annals of railway enterprise in this country. It is nearly ten years since the company made their first independent attempt to extend their line in a southerly direction, from Beighton to Chesterfield, and thus secure a share of the heavy traffic from the rich coalfields in Derbyshire and Nottinghamshire. A Bill with this object was, owing to a misapprehension, thrown out in committee, but subsequently, by dint of dauntless persistency, the company obtained Parliamentary sanction to a scheme embracing the construction of a line from Beighton to Annesley, with running powers from the latter place into Nottingham, for which privilege they were indebted to the Great Northern Company. In 1891 the company promoted a Bill for a line to cover the whole distance between Annesley and Quainton Road, near Aylesbury (Bucks), where it was proposed to effect a junction with the Metropolitan

TOURS ET TOURELLES HISTORIQUES DE LA BELGIQUE, or THE HISTORIC TOWERS AND TURRETS OF BELGIUM. From the water-colours of JEAN BAES. Among the architectural publications on the ancient edifices of Belgium, scarcely any can be found which give a reproduction of the admirable towers and charming turrets, so justly considered of the greatest interest. This work consists of 50 coloured folio plates, difficult to distinguish from the originals, mounted on handsome cardboard and contained in a rich portfolio. Price £4.

TRAVAUX D'ARCHITECTURE EXECUTÉS EN BELGIQUE, or ARCHITECTURAL WORKS EXECUTED IN BELGIUM, by HENRY BRYAERT, Architect. This work contains the most interesting productions of Henry Beyaert, and presents, with fullest details, his principal edifices. It is the reproduction of his own designs arranged by himself. Each construction is explained by plans, details, elevations, sections, &c., drawn to scale. The work will be published in twenty to twenty-five parts, consisting of ten folio plates each, appearing quarterly. Thirteen parts are already out. Subscriptions are received for the entire work only. Price per part, 1's.

L'EMULATION.

A MONTHLY JOURNAL. ORGAN OF THE "SOCIÉTÉ CENTRALE D'ARCHITECTURE" OF BELGIUM.

The latest volume of the New Series is in preparation, and will form a valuable addition to the Collection. Each number consists of four or five folio plates, eight pages of text, and a supplement of twelve pages. It produces in chromolithography, heliogravure, phototype, etching, &c., prominent examples of ancient and current architecture, and the text is devoted to this profession. The Supplement contains articles pertinent to architecture, and advertisements. Subscriptions date from January 1. Price per year £1 8s. The whole year, when complete, in portfolio, £1 12s.

line. This Bill was, however, thrown out. The following year the company deposited an amended Bill, and after a prolonged struggle, in the face of strong opposition, the scheme was passed by both Parliamentary committees. The undertaking is the largest of the kind that has been attempted for many years, and marks an epoch of vital importance in the history of the coal trade of South Yorkshire, Notts and Derbyshire. The company will be able to carry a large tonnage direct to London, instead of handing it over to the other companies at Doncaster. In addition, the line will provide a new and independent route from Lancashire and Yorkshire to London, placing Chesterfield, Nottingham, Loughborough, Leicester, Lutterworth, Rugby, and other places on the main trunk line, besides providing railway accommodation for extensive districts at present inadequately served, if served at all. Apart from this extension the company's system consists mainly of a line running from west to east, starting at Southport, Liverpool and Chester, and passing through the thickly populated manufacturing towns of Lancashire and Yorkshire, as well as the Notts, Derbyshire and South Yorkshire coalfields, and the important iron and steel manufacturing centre of Sheffield and district, to such important towns as Grimsby (the largest fishing port in the world, and owned entirely by the company), Hull, and Cleethorpes. In following the action of the other railway companies in extending their line and getting into London, the Great Central Company were animated by the knowledge that out of the gross receipts from the traffic put on their existing system they received only 33·35 per cent., while other lines took 66·64 per cent. Another reason for their action, as Lord Wharnclyffe, the chairman of the directors, pointed out in a speech delivered on the occasion of the sod-cutting ceremony, was that for thirty years no single new line had gone into London, and that London had been increasing at the rate of something like 70,000 people a year. The northern section of the new line extends from Rugby, by way of Leicester, Loughborough, Nottingham, to Annesley, where a junction is effected with the Great Central Company's existing line. Mr. E. Parry, of Nottingham, is the engineer for this portion of the work, Messrs. Logan & Hemingway being the contractors. The southern division—that between Rugby and London—is under the engineering supervision of Sir Douglas Fox and Messrs. Francis & Douglas Fox, of Westminster, and the contractors are Messrs. Oliver & Son and Messrs. Walter Scott & Co. Ninety-one miles from Annesley, along the route of the new line, at

Quinton Road, the Great Central trains will pass on to the Metropolitan Railway Company's system, and travel thereover for a distance of about forty miles, branching off at Finchley Road, and taking an independent course for a little less than three miles, thence to the metropolitan terminus adjoining the Marylebone Road. That portion of the undertaking which lies in London is being carried out by Mr. Firbank, the contractor, under the direction of Mr. E. Wragge, the resident engineer.

Along the section from Annesley to East Leake the contractors have made good progress. Especially is this so in regard to the extensive works which are being executed in the city of Nottingham. For the purposes of the New Central Station a vast amount of property has been demolished, and several of the oldest streets in the borough have thus disappeared. A number of steam navvies have been utilised for some months past excavating on the site of the New Central Station. The Great Northern Company's extension from their present terminus in London Road to the New Central Station, a distance of some 600 yards, is in a forward state. The line runs under a covered way along Thurland Street, emerging at Weekday Cross, the site of the old Town Hall. Thence the metals are carried over a viaduct to the Midland station, which is crossed by means of massive iron girders. The viaduct extends from here to the river Trent, traversing the densely populated Meadows district, the river being spanned by a handsome bridge. From the Trent to the village of Wilford a huge embankment has been constructed, on which the permanent way is laid, and thence to East Leake the line passes through a fairly hilly district. The company have had to erect a large number of artisans' dwellings on the northern side of the Central Station in Nottingham, and others will be built in due course. The goods yards in the Meadows are being speedily formed, and at the Carrington end of the city gasworks are being constructed. Considerable activity prevails at the present time in the neighbourhood of Loughborough. On the site of the town station several hundred men are engaged, whilst at Leicester and Rugby satisfactory progress is being made with the line.

In relation to the southern section of the undertaking, a considerable amount of earthwork has had to be done. At the present time about one-half of the permanent way has been laid. Five lines of metals will run into the passenger terminal station, which is being constructed on an extensive scale. A goods warehouse is being erected, with a floor space of about

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "**The Pittman Paint**" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact **it will Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION.

11½ acres. Commodious engine works, a shunting shed, and numerous sidings are in course of construction at Neasden. The damage which it had been feared would be caused to Lord's Cricket Ground by the new line has been averted, and, indeed, the M.C.C. have greatly benefited as a consequence of the undertaking. More than half of the 3,960 yards of the new railway at the metropolitan end lies below the ground. The longest tunnel which is being made within the London area will be 37 chains in length. The establishment of a connection with the East and West Junction Railway at Byfield, and the construction of a branch line from Woodford to Banbury in conjunction with the Great Western Railway, will increase materially the facilities afforded by the new line. The company have had to erect artisans' dwellings to accommodate 3,000 people displaced by the operations of the contractors.

NEW GASWORKS FOR EDINBURGH AND LEITH.

At a special meeting of the Edinburgh and Leith Gas Commission a report was submitted of the works committee with regard to a site for the proposed new gasworks. Since 1888, when the Gas Commissioners took over the undertaking, their administration had been most successful. Everything had gone on smilingly, and they were now brought to the position of requiring to look beyond the capacity of their present works, and consider what the future administration in respect to the supply of gas to Edinburgh and Leith would be. There was immediate necessity of increasing the present storage plant, as it was worked to its utmost capacity. The introduction of the electric light had accelerated rather than decreased the demand for gas, and the experience of Edinburgh in this respect was the same as other large towns in the United Kingdom. The physical conditions rendered an extension of the Edinburgh works impossible, and the structural conditions of the Leith works required immediate and thorough reconstruction; but even though the available land at Leith was used and the works remodelled, the output could not be largely increased there. Their eminent engineer, Mr. Herring, had indicated the necessity of transferring the present works to one centre of operations. This principle had been approved, and it was remitted to the works committee to recommend suitable sites. The committee had had ten sites under consideration, four of which were considered unsuitable owing to the impos-

sibility of getting both systems of railway—viz. the Caledonian and North British—into communication with them. The other six were personally visited, and two of these, Granton West and Fillyside, were considered eminently suitable sites. After further consideration, the Granton site was looked upon as the best in several respects. The land was to the west of Granton Harbour. They had connection with both railway systems, and Leith Harbour would be at their service to compete with the Granton Harbour. These were a combination of circumstances which could not be rivalled. There was a tip for the refuse, which would last for a period of ten years and probably more, and the money value of that represented a considerable sum. There would be no nuisance to the public. The North British Company realised that they would be a good deal out of their way if they were absent from New Street, Edinburgh, in respect that the gasworks trains were shunted in the Waverley Station. Therefore they had promised to continue the present rate charged to Leith and to Edinburgh when they were removed to Granton, although the mileage was somewhat greater. The sub-committee had adjusted all conditions before approaching the price, and they had made very satisfactory terms with the Duke of Buccleuch. Apart from the monetary advantages which would accrue from the railway competition and the carriage by water, the facilities they would have in the export of coke and similar products, it was most satisfactory to confirm the original statement that the saving on production in the new works with modern plant would be sufficient to pay interest and sinking fund charges upon the capital outlay once the works were put into operation. The financial calculations were based on the present quantity of gas manufactured, without taking into consideration any increase whatever. They must be kept in mind that ultimately they had a very valuable asset in the sites of the present undertakings, and he was misinformed as to values if the value of these was not quite equal to the price they were paying for Granton. The purchase price was 124,000*l.* The area of the land to be acquired was 106½ acres, which worked out at a rate of 1,167*l.* per acre. In addition to that, they had power to reclaim from the foreshore something like 4½ acres. There would be a little cost involved there, but they had secured that right, and it would be valuable in many respects. The increase in the capital expenditure since the Commission was formed was 118,121*l.*; 90,476*l.* had been expended on new main pipes, service pipes and meters, leaving only 27,645*l.* of an increase of capital expenditure, pertaining particularly to the works at New Street. At any rate,

they had got ten years out of it; and as it would likely be ten years before they could be removed, they would have recovered the value of a good deal of that. They would run down the plant gradually, consistent with working and safety, and they would take as much out of the old works as possible before leaving them.

UNIFORM SAFE LOADS FOR BUILDING FLOORS.*

SOME time ago I received a letter from your secretary requesting me to prepare a paper on the "Uniformity of Safe Loads for Building Floors," which should contain my views on this subject, and as it is one on which I have decided opinions, I am pleased to accept the invitation, and if my paper shall be of any help to you I shall feel fully repaid for my pains.

I may say in the beginning that I believe that our building regulations should be as definite as it is possible to make them, so that the architect can know just how to prepare his plans to comply with the ordinance and obtain a permit, and that those provisions which apply to the strength of the building should be both definite and reasonable. There should be no chance for dispute, in the average building at least, as to the necessary size of beams, girders, columns and piers to meet the legal requirements, neither should these requirements be so unreasonable that it is impracticable to enforce them. It also seems desirable that the requirements for safe loads, &c., be uniform throughout the country. In this respect, more than in any others, the conditions are the same in all localities. Our people live in the same way and weigh practically the same in one city as in another; a bale of merchandise weighs as much in a store in Denver as in Boston, and timber and metal does not lose its strength by being transported from one State to another; hence there is no reason why a floor that is to be used for a given purpose should not have the same strength in Chicago as in New York.

But when we compare our building laws we find that no two have exactly the same requirements. In fact, it has been within a very few years that the matter of floor loads and the strength of materials has been given the consideration in building regulations that their importance demands, and I

* A paper read by Mr. F. E. Kidder before the convention of the International Association of Building Inspectors, held at Detroit, Mich., and published in *Architecture and Building*.

wish to say here that the two subjects cannot well be considered separately, as both must be considered in determining the size of floor beams. The early New York and Boston building laws did, indeed, specify certain minimum floor loads, but as no unit strains were fixed the laws in this respect were inoperative, and my own observation has been that little attention was paid to the requirements. I consider that the present ordinance of the city of Chicago was the first in which the floor loads and unit strains were fixed on a basis where they could be enforced with anything like justice to the owners, and even this law I believe could be improved. The present New York law on these matters is absurd and not in compliance with the practice of our best structural engineers, and the Boston law is far stricter in its requirements for wooden floors than the safety of the building demands.

I believe that the minimum loads for floors should be sufficient to meet any probable or reasonably possible loading, but it is not just to go beyond this, and, as I have said, where the requirements are unreasonable it is very difficult to enforce them.

It is rarely, if ever, that the floors of a dwelling, tenement or lodging-house, or the rooms in a hotel, are loaded to more than 20 lbs. per square foot for the entire area, and a minimum load of 40 lbs. per square foot should provide for all possible contingencies, especially as the beams, if proportioned by the unit strains now generally used, would carry twice their calculated loads for a considerable time without falling.

The same floor loads that are fixed for dwellings should obviously be sufficient for floors of sleeping rooms, whether in dwellings, lodging-houses, or hotels; in fact, the purpose for which a building is to be used should determine its construction rather than the name by which it is classified.

The floors of offices are, as a rule, not more heavily loaded than dwellings, but the possibilities for increased loads in the way of safes and heavy furniture, and possibly of a more compact crowd of people, are greater, so that the minimum floor load for offices should be somewhat increased. You, gentlemen, are acquainted, I presume, with the investigations of Messrs. Blackall & Everett, of Boston, in which they found that the average live load in 210 offices, in three prominent office buildings, was between 16 and 17 lbs., while the average load for the ten heaviest offices was 33 lbs. As such loads, however, are not usually evenly distributed, some portions of the floor being generally much more heavily loaded than the others, it would not appear to be safe to use the aver-

SOHO COWL & VENTILATOR

(NICKLIN & MILWARD'S PATENT.)

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."

"Forward the 10-inch cowls on order at once; we have fixed the others, and find they give every satisfaction."

"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

age above determined for determining the strength of floor beams and arches, although it would probably answer for the columns. There seems to be considerable difference of opinion among the leading architects and structural engineers as to just what allowance should be made for office floors. In the Mills building in San Francisco the live loads were assumed at 40 lbs. per square foot for all floors above the first; in the Venetian building, Chicago, the second, third and fourth floors were calculated for 60 lbs. and the upper floors for 35 lbs. live load per square foot, while in the Old Colony and Fort Dearborn buildings in Chicago the live loads on the floor beams were assumed at 70 lbs., in accordance with the building ordinance.

Apparently, however, the provisions of the building ordinance in this respect do not have much effect with the architects of our tall buildings.

The building laws of Boston and New York require a minimum live load of 100 lbs. per square foot, which is obviously excessive. A minimum live load of 60 or 70 lbs. for the floor beams would seem more equitable and perfectly safe, at least for the upper floors, and 80 lbs. for the first and second floors, unless used for stores.

The loads for the floors of schools, churches and theatres have also been very much overestimated in the older building laws, which, for the last two classes of buildings, fixed a minimum live load of 120 lbs.

The average size for a schoolroom is about 28 by 32 feet, and these usually contain seats for fifty-six scholars and the teacher. Assuming the average weight of each scholar at 120 lbs., we have for the average live load, including ten visiting adults and the desks and furniture, 13 lbs. per square foot. Even supposing that the scholars of two rooms were united for some special occasion, we would have but 21 lbs. per square foot, and this is as great a load as it is possible to imagine in such a room, as the fixed desks prevent the crowding together of the scholars except at the sides of the room. From this reasoning therefore a minimum load for the schoolrooms of 50 lbs. per square foot would appear abundant.

As a matter of fact 3 by 14-inch Georgia pine beams, 16 inches on centres and 28 feet span, have been used for schoolroom floors for years, and no practical person would doubt their safety, but such beams, if calculated by the formula for stiffness as herein recommended, would only support a live load of 56 lbs.

The minimum floor-space allotted to a single seat in

theatres is 4 square feet, while the average is about 5 square feet. Assuming the weight of an opera chair at 35 lbs., and of the average adult at 140 lbs. (a liberal allowance), we have an average of 44 lbs. per square foot of floor. A minimum of 80 lbs. would therefore seem to provide for any possible crowding during a panic except in the corridors. It has been shown several times that it is possible to pack able-bodied men so as to produce a load of just 120 lbs. per square foot, and I believe that this should be the minimum for assembly halls, without fixed desks, and also for the corridors of all public buildings. For armouries the minimum load should be increased on account of the vibration produced.

The average floor loads for stores has also been greatly overestimated. Mr. W. L. B. Jenney found that the average load on the floors of the wholesale warehouse of Marshall, Field & Co., in Chicago, was but 50 lbs. per square foot, and very few retail stores will average over 80 lbs. An allowance of 120 lbs. is sufficient for any ordinary retail store, with the possible exception of hardware stores.

Warehouses, on the other hand, may be very heavily loaded, and special provisions should be made for them.

I have now, in a general way, given my opinion on this subject, and I will conclude with a summary drawn up in the shape of a section to a building ordinance, which I believe combines absolute safety with proper allowance for economy. I will further add that I am strongly of the opinion that no city has a moral or legal right to require a greater use of materials than these provisions call for, and if included in a law I believe that they could and should be enforced.

Summary.

"Sec. —. The floors of all buildings shall be designed and constructed in such a manner as to be capable of supporting in all their parts, in addition to the weight of partitions and permanent fixtures and mechanism that may be set upon the same, the following minimum live loads for every square foot of surface of such floors:—

	Lbs.
For dwellings, sleeping and lodging-rooms	40
„ schoolrooms	50
„ offices (upper storeys)	60
„ stables and carriage houses	65
„ banking rooms, churches and theatres	80
„ assembly halls, dancing halls and the corridors of all public buildings, including hotels	120
„ drill-rooms	150

READING CASES FOR THE ARCHITECT.

Price Two Shillings.

Offices: 175 Strand, London, W.C.

"Floors for ordinary stores, light manufacturing and light storage to be computed for not less than 120 lbs. per square foot, and to sustain a concentrated load at any point of 4,000 lbs.

"Floors constructed for the above loads shall not be used for heavier purposes except upon permit obtained from the building inspector.

"Any floor or portion of floors in any building intended for heavier floor loads or concentrated loads shall be constructed to support the loads for which they are intended."

For the unit strains for the strength of wooden beams and posts, I believe those contained in the Buffalo building ordinance are as nearly perfect, all things considered, as can be laid down.

In some localities, however, other woods are used for framing timbers, and should be included in any standard which your association may choose to adopt. For some of these woods I give the values which would correspond to those fixed for hard pine, white pine and spruce :—

	Posts.	Beams.
Oregon pine	900	180
Texas (hard) pine	850	180
Redwood	625	120

I also believe that the sizes of wooden floor beams for buildings in which the live loads are assumed at less than 80 lbs. should be determined by the formula for stiffness. The draft for a new building ordinance for the city of Denver contains the following section, which I believe is a very important supplement to the usual provisions for the strength of floors :—

Sec. —. All wooden floor beams in buildings of Classes II., III. and IV. shall not have a greater span than that determined by the following formula, and no floor beam over 12 inches in depth shall be less than 2½ inches thick :—

$$L = \sqrt[3]{\frac{8BD^3e}{5WS}}$$

L=maximum span in feet.
 B= breadth of beam in inches.
 D= depth of beam in inches.
 S= spacing of beams from centres in feet.
 W= combined weight of floor and load per square foot.

e = { 125 for Texas pine.
 110 for Oregon pine.
 81 for Colorado or Mexican pine.

This formula will require about the same size of floor beams as the formula for strength up to a span of about twelve times the depth of the beam, but as the proportion of the span to the depth of the beam increases the sizes determined by this formula increase materially.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 25252. Richmond & Co., Limited, and Edmond Walter Tyrrell Richmond, for "Improvements in or connected with heating apparatus."
- 25259. Jacob Grossman, for "Improved method of treating sewage."
- 25685. Arthur Kupper, for "Improvements in manufacturing hollow building blocks or artificial stones, and in apparatus employed in their manufacture."
- 25702. Clifford Lax, for "Improvements in strainers for sinks, baths, lavatory basins and the like."
- 25705. Alfred Henry Weston and John Gregory Webb, for "Improved runner appliance for supporting curtains and screens on cornice and like poles."
- 25709. Samuel Cash Shewell and William Richard Clark, for "Improved inlet ventilator for drains and sewer pipes."
- 25780. John William Witter, for "Improved flushing apparatus for urinals, water-closets and the like."
- 25802. John Edwin Place, for "Improved means for connecting sanitary pipes."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from 1/4th in. to 6 in. wide. Strands from 24 B.W.G. to 3/16th in. thickness of steel.

- FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.
- FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.
- FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.
- FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.
- FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

- OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.
- BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xv.

COMPETITIONS OPEN.

BELPER.—May 1, 1898.—The Belper Urban District Council offer premiums of 50 guineas and 25 guineas for the two best schemes of sewage disposal. Mr. Joseph Pym, Urban District Council Offices, Belper.

BOOTLE.—Dec. 31.—The Corporation invite competitive designs of a central fire station, firemen's dwellings and district police station. Mr. J. A. Crowther, borough engineer, Bootle.

CARDIFF.—Dec. 4.—The Corporation offer premiums of 500*l.*, 300*l.* and 200*l.* respectively for the three best designs for a new town hall, law courts, &c. Mr. W. Harpur, Town Hall, Cardiff.

DORKING.—Dec. 15.—Competitive designs and plan, with descriptive report thereon and approximate estimates, are invited for erection of infirmary upon workhouse grounds. Mr. George Scales, 35 High Street, Dorking.

SOMERSET.—Nov. 30.—The Council invite competitive plans for large hall, with cloakrooms and retiring-rooms over present post office, market house and fire-engine house communicating with the town hall, and for conversion of market house, &c., on ground-floor. Premiums of 25*l.*, 15*l.* and 10*l.* will be awarded. Mr. Regd. L. Foster, town clerk, 1 Cathedral Green, Wells.

CONTRACTS OPEN.

ABERYSTWITH.—Dec. 4.—For completion of the building of the chancel and vestries of the Holy Trinity Church. Rev. Prebendary Williams, Abergeldie House.

ASTLEY.—For erection of a small house. Mr. John R. Withers, architect, Shrewsbury.

BARROW-IN-FURNESS.—Dec. 4.—For erection of stores in Hindpool Road. Mr. John Butler, architect, Cornwallis Street, Barrow-in-Furness.

BELFAST.—For erection of three terrace houses at Whitehead. Mr. Henry T. Fulton, architect, 91 Donegall Street, Belfast.

BLACKPOOL.—For erection of four large detached houses in Lytham Road. Messrs. Goldsmith & Son, architects, 63 Faulkner Street, Manchester.

BODMIN.—For erection of isolation hospital on grounds of county asylum. Mr. Silvanus Trevail, architect, Truro.

BRADFORD.—For plastering seven houses at Undercliffe. Messrs. Wm. Totty & Sons, Undercliffe.

BRAEMAR.—Nov. 30.—For additions and alterations to Fife Arms Hotel. Mr. A. Marshall Mackenzie, architect, 1 Bon Accord Street, Aberdeen.

BRIDLINGTON QUAY.—Nov. 30.—For erection of dwelling-house, conservatory and premises. Mr. J. Earnshaw, architect, Bridlington Quay.

BRISTOL.—Nov. 29.—For erection of a pupil teachers' centre in Broad Weir. Messrs. La Trobe & Weston, architects, 20 Clare Street, Bristol.

CASTLEFORD.—For erection of Victoria Hotel, Allerton Bywater. Mr. Arthur Hartley, architect and surveyor, Carlton Chambers, Castleford.

CHRISTCHURCH.—Dec. 4.—For erection of lying-in ward and addition to infirmary at workhouse, Fairmile. Mr. E. H. Burton, architect, Bournemouth.

CLAYTON.—Dec. 8.—For erection of eleven terrace houses at Chrisarben Park. Mr. Sam Spencer, architect, &c., 344 Great Horton Road, Great Horton.

COUPAR ANGUS.—Dec. 4.—For farmhouse at West Haugh Farm. Mr. Reid, architect, Cupar Angus.

CUMBERLAND.—For heightening and repairing wall near post office, Lazonby. Mr. James, Silloth.

DARTFORD.—Dec. 1.—For erection of the brick retaining wall on East Hill, from nearly opposite Great Queen Street to the entrance to East Hill House; also the laying of Guernsey granite channelling from Darenth Road to a point opposite St. Albans Road. Mr. W. Harston, surveyor, High Street, Dartford.

DEAL.—Nov. 29.—For construction of an underground convenience near the South Parade. Mr. Thos. C. Golder, surveyor, 16 High Street, Deal.

DUBLIN.—Nov. 29.—For alterations at Aldborough House. Mr. H. Williams, secretary, Office of Public Works, Dublin.

ENFIELD.—Dec. 2.—For erection of a junior mixed department at Chesterfield Road school, Enfield Lock. Mr. G. E. T. Laurence, architect, 181 Queen Victoria Street, London, E.C.

ESSEX.—For addition to The Cedars, Great Horkesley. Mr. Chas. E. Butcher, architect and surveyor, 3 Queen Street, Colchester.

FALKIRK.—Nov. 29.—For erection of additional cells at Falkirk County Buildings. Messrs. A. & W. Black, architects, Falkirk.

GLASGOW.—Nov. 30.—For erection of three tenements at the corner of Gallowgate and Bain Square. Mr. J. D. Marwick, town clerk, City Chambers, Glasgow.

ARCHITECTS PLEASE NOTE.

VARIETIES.

THE Methodist New Connexion's new hall, at the corner of Camden Street, Newcastle, adjoining the Salem Chapel, was opened on the 17th inst.

SOME alarm has been aroused amongst the residents in the vicinity of St. Thomas's Church and Bridge Street, Batley, owing to what is considered to be unmistakable evidence that a gradual subsidence is taking place.

THE Surveyors' Institution have decided upon a new departure. They have adopted the idea of holding country meetings, and the first of such gatherings is to be held in Manchester next April.

THE London and India Docks joint committee have decided not only to considerably increase their warehousing accommodation at the Royal Victoria Dock for frozen produce, but also to give special facilities for the discharge of the meat direct from the refrigerating chambers of the steamers to the cold-air stores on the dock quay, thus obviating any injury to the meat from exposure, as at present, during the discharge of the ship.

It has been decided to put new roofs on the nave and north and south aisles of Wolvey (near Nuneaton) parish church, at a cost of about 600*l*. The old church dates back to the days of Edward the Confessor. The oldest part of the present building which can be verified is the south doorway of 1150, and there are several other Saxon remains to be found in the structure.

THE new Sunday-school built by the Primitive Methodists of Wortley was recently opened. The school, which has been erected at a cost of about 1,000*l*., is a plain structure, consisting of central hall, three classrooms, kitchens, heating apparatus and conveniences. The architect was Mr. Thomas Howdill, of Albion Street, Leeds.

A MEMORIAL-STONE will shortly be placed at Sandal, near Wakefield, to mark the exact spot where it is said that Richard, Duke of York, fell at the Battle of Wakefield during the Wars of the Roses. The inscription is as follows:—"Richard Plantagenet, Duke of York, fell on this spot in the Battle of Wakefield, December 30, 1460. This stone is erected in 1897 by some who wish to preserve the traditional site."

A NUMBER of large Gothic villa residences are in course of erection in the Woodbourne Road, Edgbaston, Birmingham, on the building estate of the Right Hon. Lord Calthorpe. The contractor is Mr. Edward Airey, of Gillott Road, Birmingham. At the village of Knowle, about 9 miles from Birmingham, a number of old cottages belonging to Mr. Samuel Scoltock, having a frontage of about 70 feet, have been entirely remodelled. The whole of the internal portion has been "guttered," the building raised several feet, and the front elevation, Gothic in style, brought up to date by the insertion of bay and two-light windows, porch, shop front, ornamental cornice, chimney-caps, moulded barge-boards, &c. The facing and ornamental bricks were supplied by Mr. Loughton, of Garrison Lane; the grates, chimneypieces, &c., by Councillor Smith, of Smethwick; and the ornamental woodwork by

Messrs. Parker, the well-known joinery manufacturers, of Conybere Street, Birmingham. The contractor was Mr. S. Needle, of Knowle; and the architect Mr. J. Statham Davis, of Sparkbrook, Birmingham.

A TERRIBLE fatality recently occurred at Trevvado Viaduct, on the Cornwall Railway, between Liskeard and Menheniot. A new five-arch viaduct of granite is being built to take the place of the present wooden structure, and wooden ribs were being fixed upon which the brickwork of the arch would afterwards rest. It was while one of the ribs of the fourth arch was being placed in position that the guy rope—a 4-inch Manila cable—by which it was being steadied snapped, precipitating William Cotton and Richard Toms to the ground, nearly 80 feet. Cotton, who is sixteen years of age, was killed instantly. Toms, an ex-naval seaman, aged thirty-two, residing with his sister at Menheniot, was alive and conscious, although his left thigh was broken in several places and he had sustained severe internal injuries, but he died almost immediately. Trevvado Viaduct is only one mile from Coldrenick, the scene of the terrible accident last February, when twelve men were killed.

A MEETING of the sub-committee of the Glasgow Corporation parks committee has been held to consider an outline of the scheme proposed for the sculpture and carved work of the new Art Galleries. The following chief carvers were recommended:—North façade, William Shireffs, 287 West Campbell Street; south façade, J. C. Young, 197 Dumbarton Road; east and west façades, William Vickers, 221 West Regent Street; bronze figures on towers and north porch, A. M.F. Shannon, 7 Scott Street, Garnethill; central hall, R. A. M'Gilvray & Ferris, 129 West Regent Street; and east and west courts, James M. Sheriff, 20 Canning Place. It is estimated that the work will cost 15,644l. There is a provisional sum of 5,000l. included in existing contracts which is available towards the proposed expenditure. The sub-committee adjourned consideration of the scheme in order that more information might be laid before them as to the cost of the sculpture work.

The additions which it was found necessary to make at Ibrox United Presbyterian church have been completed, and the church has again been opened for public worship. Accommodation is now provided for about 250 additional sittings. This has been secured by the erection of transepts to the east and west sides of the church, and of a large chancel to the north, in which are placed the choir seats, and a double-manual organ supplied with hydraulic power. The organ has

been presented to the congregation by Mr. Thomas Mason, D.L. The transepts are divided from the nave of the church by Early English Gothic arches, elaborately moulded, and three-light windows filled in with Flamboyant tracery, and glazed with cathedral-tinted glass of antique design. The roofs are treated with hammer-beam couples, and the spandrels and apex are filled in with carved tracery of ornate design. The chancel is divided from the nave by a richly-moulded arch springing from clustered columns, having moulded bases and capitals resting on carved brackets. A handsome octagonal pulpit of wainscot oak has been placed on the east side of the chancel, having carved panels and string-course and buttresses resting on a corbelled pedestal with fret rail of wainscot oak. In front of the organ are choir seats, having ornate carved and moulded ends, with pillars and bases richly moulded in wainscot oak. There has also been added a new communion table and chair and a baptismal font, all in wainscot oak. The extension has greatly improved the appearance of the building both externally and internally, as well as the acoustics, heating and ventilation. Altogether the church is now more in keeping with modern ideas. The hall accommodation under the church has also been enlarged. Suites of rooms and cloak-rooms have been provided, and the heating and ventilation rearranged. All this will give greater facility for the working of the various undertakings in which the congregation is engaged. The whole work has been carried out from plans prepared by Messrs. Bruce & Hay, architects, West George Street.

THE new St. John's Roman Catholic church, which has been erected in Portugal Street, South Side, Glasgow, was opened on Sunday last. The new church, which takes the place of an old and well-known edifice, is a plain but substantial and rather handsome building. It is in the Early Decorated style, is built of Giffnock stone, and consists of chancel, side chapels, nave, aisles, sacristies, &c. The nave is divided into six bays. There is a four-light traceried window in each bay of the clerestory, which is carried by an arcading dividing nave from the aisle, each bay of which is pierced with two two-light windows. The west wall of the nave (the gable of which is pierced with a fine rose window) is supported on three arches opening into choir and organ chamber, which is approached from the porch by a stone staircase. The internal length of the church is 148 feet and the total width is 64 feet. The nave is 28 feet wide and the height to apex of roof is 60 feet. The altar, with superaltar and tabernacle, are of Caen stone. The canopy is of wood gilt. Curtains are suspended from richly-

147 STRAND, LONDON, W.C.

wrought metal-work starting on each side of the canopy and continuing the whole length of the altar. The whole has been designed and carried out under the direction of the architects, Messrs. Pugin & Pugin, of London.

WHEN in South Staffordshire the other day we had occasion to visit the well-known brickworks and sand quarry adjoining the Birmingham Canal at Morley, near Wednesbury, for many years carried on by the late Mr. Thomas Bromley, and since by Mr. W. R. Price. We were at once struck with the great improvements that have recently taken place. Here is to be found a wonderful supply of all sorts of sand, including the noted fine loam sand used by brass-casters and malleable iron-founders. Above this sand lies a rich clay, from which a good common red brick is made, and it is in this department where the present owner has developed the undertaking. A new machine supplied by Mr. Cox, of West Bromwich, capable of turning out 100,000 a week, and driven by a powerful engine, has been laid down, and, together with drying stoves and four large modern kilns, is producing a much improved and sound brick. As a convenience for catering with local builders there is the advantage of lime being burnt on the spot. It is contemplated turning out a pressed facing brick, and from what we saw of the raw material and appliances at hand we feel sure a good brick will be forthcoming. Mr. R. J. Price is the owner of some fifteen acres of contiguous land, and we trust that the enterprising spirit shown by him since taking on the business of his father, Mr. W. R. Price, whose death occurred twelve months ago, and in whose name he trades, will prove successful and be a source of remuneration for many years to come.

THE large and handsome new club premises in connection with the Skipton Liberal Association are now completed, and were informally opened on Monday evening. The total cost of the premises will amount to nearly 5,000/. The building fronts to Keighley Road and Sackville Street. On the ground floor there are six large lock-up shops, near the centre of which is the main entrance to the club, above these being a wide staircase and corridors leading to all the rooms. On the first floor there are smoke-room, reading-room and library, and the two former are connected by sliding doors, so that they can be made into one room to seat at least 150 people. There are three other rooms on the same floor, besides bath-rooms, &c. On the second floor there are two recreation-rooms and curator's private room. On this floor there is a very large billiard-room, 52 feet by 32 feet 6 inches, containing three full-sized tables.

Adjoining this is a private billiard-room. The top floor also contains the curator's living rooms. The heating is done from a cellar under the staircase. The whole arrangements are elaborate and up to date, and are admirably adapted to the requirements of the Liberals in the town and district. Mr. James Ledingham, of Bradford, was the architect.

THE Elland Sewage Works were, on the 13th inst., publicly opened by the chairman of the Council, Mr. Mackrill, who gave a brief history and description of the scheme. The works consist of outfall and other sewers, settling tanks holding 600,000 gallons, with the buildings and necessary machinery and 12 acres of gravelly land laid out for filtration. Many difficulties had to be overcome, including cast-iron pipe sewer across the canal and the river Calder and also along the river bed. The scheme provides for the treatment of a present flow of 600,000 gallons of sewage and trade refuse from woolleh mills and dye-works, &c. The works were designed and carried out under Mr. Malcolm Paterson, M.Inst.C.E., at a cost of about 13,500/., exclusive of land, the contractors being Messrs. A. Graham & Sons, sewers and tanks, Wm. Foster, land filtration works, and Jno. Wolstenholme, machinery. The Council have decided to admit all trade liquid refuse to the sewers, and the chemical treatment before filtration will be by lime and alumino-ferric.

A SERIES of renovations and alterations have been effected in connection with Deane (Yorks) parish church, which result in a great improvement. In the interior of the venerable edifice the clergy and choir vestry has been made more convenient, the old roof having been taken away, and a new one of lead has been substituted at a greater altitude. Hot-water apparatus for warming the vestry has also been put in, and this apartment has been connected by a doorway with another vestry in the tower, underneath the belfry, and the two vestries can be used simultaneously. Over the principal vestry a muniment-room, for the safe keeping of parish ecclesiastical documents, has been provided; new windows, for which some old stonework belonging to the church has been utilised, have been placed in the vestry, this part of the church having been now made to correspond with the other part of the north aisle. A new peal-board has been affixed in the belfry, and this will be of great advantage. Dry-rot having shown itself in various parts of the church, all the old woodwork has been removed and fresh flooring, &c., put down. New gas standards have been affixed in the Hulton Chapel, and new gaslights have likewise been introduced into the opposite side of the church.

22 & 23 SOHO SQUARE, LONDON, W.

A HOUSE in one of the courts off Bedfordbury, close to Charing Cross, collapsed on the 18th inst., rendering between twenty and thirty people homeless. The house was under repair at the rear, the walls of the staircases having been removed six months ago and the stairs propped up with wooden supports. The walls facing the court, however, proved to be more unsafe than the supports, and about three o'clock in the morning the wall on the top floor of the three-storey building gave way. The roof also collapsed. Fortunately, before this happened the people who had been sleeping on the top floor made their escape. There were three or four families occupying rooms on the various floors, and these made their escape before further damage was done.

THE newly erected additions to the Aston Workhouse have been formally opened. They consist of a block of buildings providing accommodation for aged married couples, who are proved to have led respectable lives, and another building for male vagrants, containing sufficient room to enable the guardians to detain the professional tramps two nights, instead of only one as is at present the case, whereby it is expected to greatly reduce the number of vagrants calling at the house, who owing to the considerate treatment they have received at the Aston Workhouse have during the last few years increased in number to an alarming degree. Wherever the system of detaining the vagrants two nights has been put in force the numbers have decreased by half. The new works also include several other minor alterations and improvements, and have been carried out at a cost of 5,803*l.* by Mr. W. S. Seamark, and according to the plans of Mr. C. Whitwell, architect. The aged people's quarters consist of a two-storey building, which is fitted up with every comfort. Accommodation is provided for ten couples, five on each floor. The approach to the upper rooms is by a stone staircase, which gives access to a verandah, on to which the doors of the apartments open, and from which the outlook is most pleasant. An excellently fitted-up bathroom is also provided. The building for the vagrants is situated on the south side of the workhouse, and contains twenty-six separate sleeping cells and thirteen stone-breaking cells, a large bath-room, day-room and attendants' room, and a very comfortable house for the occupation of the labour master has been erected near. Iron staircases have been erected outside certain departments of the house for purposes of escape in case of fire, and new heating apparatus fitted up.

CAN BUILDINGS BE MADE FIREPROOF?

At a meeting of the American Society of Civil Engineers on November 3 Mr. Corydon T. Purdy, M.Am.Soc.C.E., presented a paper entitled "Can Buildings be made Fireproof?" basing his remarks largely upon the much-discussed Pittsburg fire which occurred on May 3. The Horne store was provided with the hard tile side construction system, the Horne office building with the porous tile-end construction, and the Methodist Book Concern with 6-inch concrete floors reinforced with wires and gas-pipe. In the former buildings tile partitions founded upon a wooden frame were used. Expanded metal nailed to wooden joists supported the plaster on the partitions in the Book Concern building.

After an elaborate description of the building, Mr. Purdy, says the *Engineering Record*, criticises the construction evidently in the belief that if the columns, beams and girders had been more securely tied together the water-tank, which fell during the fire, would not have caused as much damage to the steel frame as occurred. He condemned the use of wooden joists in partitions, and advocated some form of protection for the large windows which were necessary to obtain sufficient light. Sprinklers, he said, might be devised as a special protection for store windows. The author stated that, however perfect a scheme can be worked out for fire protection by the use of water, the importance of separating floors from each other, at least in an emergency and when not in use, and, indeed, separating stores into parts in the same way, would still be vitally important.

In speaking of the action of the fireproofing in the buildings Mr. Purdy continued in parts as follows:—

The fire teaches nothing as to the real fireproof qualities of good concrete in floor construction, for the floors in the Methodist building were not subjected to a real test, as the heat on the outside of the building was only a fraction of what

it was on the other buildings, as testified to by the firemen and by the fact that the stone trimmings in the exterior walls exposed to the heat were injured in only three small places, while the fire on the inside was confined to an area entirely controlled by the fire department. Whether ordinary concrete, or, for that matter, concrete of any kind, will resist more fire and cold water than brickwork or other forms of burnt clay, is undetermined and debatable. Certainly this fire does not prove that it will or that it will not.

As between the burned material and the porous, however, the superiority of the latter as now manufactured and used was clearly illustrated. The author ventures the definite statement that partitions of 4-inch hollow, porous material made of sawdust and clay properly manufactured and properly put in place, column covering made in the same way at least 3 inches thick, and floor arches of the same material deep enough for flush ceilings, with properly designed skewbacks and beam-flange protection, will stand any possible combination of heat and water without material injury.

The same thing cannot be said, however, in regard to hard-burned clay material, as it is now manufactured, especially in the West, where, in the interest of economy, it has been made lighter than in the East, though in theory it ought to make satisfactory resistance to fire, for it is incombustible and hardened with heat, and brick which is made in the same way can be relied on to stop a fire. Yet not this fire alone, but others have demonstrated that the hard material will crack and fall to pieces under great heat even if it is not suddenly cooled with water thrown upon it.

The fireproofing work in the store, both in the arches and around the columns, was erected well. Indeed, it was probably erected better than in the average New York building, and the damage to the fireproofing in that building is primarily due to its being hard material instead of porous. The covering of the girders and beams which projected below the ceiling line was pretty generally broken, and this must have been due in a large measure to the fact that the ceiling was not a level surface, though the loss was, without doubt, increased on account of the very few divisions in the tile and the very thin walls. The material used in New York is all thicker and heavier than this was, and on that account would probably stand a fire better. That the damage to the fireproofing is primarily due to its being hard tile instead of porous is, however, shown by a comparison between the two Horne buildings. In both cases the ceiling was panelled. In the store building the bottom of the

hard tile arches was broken by the fire, whereas in the office building there was scarcely any injury of that kind. The insurance adjusters state that there is only a salvage of 16 per cent. in the fireproofing of the store building, but that they believe if the tank had not fallen the salvage would have been at least 50 per cent.

A satisfactory fireproofing material when properly constructed in all its details should not suffer a loss of more than 1 or 2 per cent. at the most.

The fireproofing in the office building suffered much more than this, but in every case there is a special cause for the injury, entirely independent of the quality or texture of the material. The adjusters report 43 per cent. loss on the partitions, and this is low when it is remembered that every partition in the building was left unsupported by the burning out of the wooden frame. The column covering resisted the fire unexpectedly well, but the single thickness of material makes a wretched covering, and it should all be replaced with hollow blocks. In places the skewbacks covering the beams projecting below the arches suffered severely. If the insurance companies were required to replace all these broken pieces, it would necessitate the removal of arches which were entirely uninjured. The author has not been able to account for the large percentage of damage allowed by the adjusters on this part of the fireproofing, 33 per cent., on any other supposition, for in his examination he found practically none of the arches injured, and the contractors in rebuilding have furnished only 300 feet of new arches, while there are 40,000 feet in the building.

Besides this, which is perhaps the most important observation in regard to the fireproofing, the following conclusions seem also to be warranted:—

The breaking of the hard tile arches on the bottom is due to the inability of the materials to withstand inequalities of contraction and expansion, and it breaks in the corners both because the strain is greatest and the tile is weakest there. There is an inequality of expansion because it is heated only on one side. The strain is greatest in the corners because the expansion of one side tends to shear that side from the adjoining ones, and it is weakest at the corners because if there is any initial stress in the material it would more naturally occur there than elsewhere, while the very fact that it breaks in that particular place more than anywhere else indicates that it is lacking in strength along the edges. The report of the board of expert engineers appointed by the appraisers furnishes some valuable facts, but some of their observations seem to the

ALL CARPETS MADE UP FREE OF CHARGE.

author extremely fallacious, and quite so in regard to this point. They state in effect that the scaling off of the lower web of the floor arches is due to the lateral motion of the ironwork caused by the heat of the fire. A panel surrounded by iron will enlarge in area if the iron expands, and if it is true, as they claim, that the iron expands more than the arches, the process of expansion would seem to relieve the arch, in whole or in part, instead of bringing any strain to bear upon it tending to its destruction. The damage to the tile is also not due to the subsequent process of construction, for, as a matter of fact, the damage to the tile occurs during the fire and not after it.

The tendency of the times is to make the material too light. If the walls of the material were made thicker, it certainly would add strength. Possibly also if the angles on the inside were rounded more, the strength of the corners would be increased. Checks and cracks in the corners of the blocks as delivered from the factory may not be particularly objectionable, so far as support to the floor is concerned, but they are objectionable in resisting fire effects, and such tile will go to pieces sooner than that which is free from such imperfections.

Possibly some clays of which hard-burned fireproofing material are made have more strength than others, and on this account alone the effect of the fire in one case can be no certain criterion of what the exact effect will be in another case, and the thickness of the walls and the various parts of the material might possibly be lighter with some clays than with others.

(To be concluded.)

TRADE NOTES.

THE Corporation Hospital, Birkenhead, is being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves with descending smoke flues

MR. EDWARD P. BOVEY, builder and contractor, of Forwood Street, Torquay, has taken up the agency for Torquay and district of Mr. L. Nicklin's Soho ventilating cowl.

MR. LOUIS HARPER, A.M.I.C.E., Aberdeen, has just supplied one of his steel rope suspension bridges, 200 feet span by 8 feet wide, to the order of the Agent-General for the Cape of Good Hope, to be erected over the Tsomo River, Cape Colony.

WE have received from Messrs. W. Davis & Sons, of Edgbaston Street, Birmingham, their price list of window-

blinds, picture-frames, mouldings, &c. This list will be found very explicit and comprehensive, and the prices will at least bear favourable comparison with those of other manufacturers.

MESSRS. CHAS. CARR of Smethwick, who have received no fewer than twelve gold medals for their bells, have been this year, and still are, exceptionally busy owing to the number of contracts they have been entrusted with for the rehanging and recasting of peals of bells in commemoration of the Diamond Jubilee, and they inform us that they have taken into their employ John Buffery (twenty-three years member of St. Martin's Society, Birmingham), the well-known and efficient bell hanger of the Midland and Northern Counties and North and South Wales.

ELECTRIC NOTES.

THE Edison & Swan Company are about to place on the market a new lamp. The chief feature of the new lamp is that it is capable of being run at a very high efficiency. This is decidedly a step in the direction of the fulfilment of Mr. Preece's prophecy that the electric light will be "the poor-man's light." On circuits, when the pressure is steady, an economy of at least 25 per cent. can be effected by the use of the new Ediswan lamp.

In addition to the arc lamps in and about the market-place and Westgate, Dewsbury, and to those intended to be placed in the new thoroughfare leading from and opposite the Great Northern Railway station to the foot of Bond Street, the Corporation lighting committee have resolved to erect additional arc lamps, and central positions have been chosen. These include Church Street and Vicarage Road, Bradford Road, near the viaduct of the London and North-Western Railway Company, Northgate, at the terminus of the Dewsbury, Batley and Birstall Tramway, Wellington Road, Daisy Hill, Nelson and Wellington Streets and Halifax Road. The paving of New Bridge Street with jarrah wood is now completed, and next week steps will be taken for erecting powerful electric lamps on both sides.

It was agreed on Wednesday at the St. Pancras Vestry's meeting to light by means of electric-arc lamps the Prince of Wales Road, Malden Road, Queen's Crescent and Ferdinand Street (from Chalk Farm to Mother Shipton), and to provide private lighting mains in these localities, at a total estimated cost of 5,422*l*.

BUILDING AND BUILDERS.

THE foundation-stone of the new parish church halls at Springburn, N.B., was formally laid on the 20th inst.

THE plans, specifications and estimates for the building of a church at New Lanark have been passed by the Home Mission committee, and the necessary grant given.

THE foundation-stone of a new infirmary for males in connection with the Kingston-on-Thames workhouse was laid on Wednesday last. The infirmary, with a nurses' home and other buildings, is to be erected at a cost of over 18,000*l*.

A SERIOUS accident occurred last week at a brickwork near Rugby. Seven truck loads of bricks, weighing 14 tons, were being run down a patent drying tunnel, which was being used for the first time, when the load overpowered the men in charge, and the waggons ran down the incline. The foreman, Joseph Negus, and a workman named William Watts, happened to be in front, and were crushed against the wall. Negus expired shortly afterwards, and Watts is seriously injured.

THE foundation-stone of a boys' new department, which is being erected in connection with the Erdington Board schools, was laid on the 16th inst., and at the same time a medallion of the Queen, which has been let into the wall in commemoration of Her Majesty's Diamond Jubilee, was unveiled. The buildings in course of erection comprise a boys' department to contain 310 scholars, a large room or workshop for manual instruction and a cookery centre. As soon as these are ready for occupation the present boys' school is to be extended so as to accommodate 120 additional scholars, and it will then be used as a girls' school. New teachers' rooms are also to be added and additional cloak-rooms formed. The amount of the builder's contract (inclusive of boundary-walls, outbuildings, forming playground, warming, &c.) is 5,629*l*.

THE attractions of Harrogate are to be enhanced by a handsome and extensive hotel, which is to be built on a site which adjoins the Spa Estate. The new Palace Hotel, which is to be erected upon the most improved principles, and fitted up with all the best and latest necessities and requirements, is to have 300 bedrooms. The area set apart for the building and the grounds will be nearly seven acres, and the elevation of the hotel will be to Ripon Road, Spring Bank Avenue and the Spa grounds, with the principal façade in the direction of the new Royal Baths. The main entrance will be directly opposite Swan Lane, but a short cut will be available with an outlet at

the lower corner of the estate, close to the old skating-rink and opposite the George Hotel, where an entrance lodge will be erected. This arrangement will give a nearer approach to the town. The work of erecting this large establishment is to be commenced in the early spring, but already the surveying of the land has been taken in hand, and London architects, conversant with the class of building required, will be invited to send in competitive designs.

THE foundation-stone of new Roman Catholic schools in Levenson Street, Willenhall, was laid on Saturday last. The Roman Catholics of the town have had day schools for about forty years in connection with their church in Hall Street, but the requirements of the Education Department have compelled them to erect new buildings. These will accommodate about 270 children, or 110 more than the existing structure. The building will be of Gothic design, and the front will consist of best red bricks relieved with Hollington stone.

COUNTY COUNCIL ESTIMATING.

SOME weeks ago several tenders were received by the Council for enlarging and altering the Hampstead fire-engine station. The architect's estimate for the work was 4,170*l*., and the lowest tender received was 4,955*l*., the excess of tender over estimate being 785*l*. The estimate was originally referred to the manager of the Works Department with a view to the work being carried out by the Department. The manager, however, reported that he was not satisfied with the estimate, and consequently the work was put out to tender. The fire-brigade committee recommended the Council to accept neither of the tenders, but their recommendation was referred back, with instructions to present a further report showing in detail the causes which had resulted in the lowest tender exceeding the estimate by so large a sum, and the amount for which the manager of the Works Department was prepared to carry out the work. The committee have now issued a further report which gives an extract from a report made to them by the architect. In this he states that the chief cause for the discrepancy arose from the fact that his estimate was made at the beginning of May last, while the tenders were received on October 26. Six months had therefore elapsed, during which time the labourers' wages and the prices of certain materials had increased. For that and other reasons it had

SMOKY CHIMNEYS

"EMPRESS" SMOKE CURE.

The "Empress" Smoke Cure has held its ground with constantly increasing sales for many years, and is now widely recognised as the best chimney-pot. The chimney which the "Empress" will not cure may be considered hopeless so far as any outside treatment goes. It must be reconstructed or the fireplace altered. At least 90 per cent. of smoky chimneys on which "Empress" is fixed are Cured.

FULL PARTICULARS OF SIZES, PRICES, &c., ON APPLICATION TO THE MAKERS—

EWART & SON,

346 Euston Road, London, N.W.

ESTABLISHED 60 YEARS.

Our Foreman in charge of this Department will attend appointments to examine chimneys and advise. For such attendance in London or suburbs no charge is made. For country appointments railway fares only are charged.

gradually become more difficult to get tenders from responsible contractors. Having looked over his estimate again, he considered that not less than 367% of the difference now in question was due to the rise in labourers' wages and materials after his estimate was made, to the fact that the work would now have to be done in the winter and other ordinary contingencies. That still left a difference of 418% to be accounted for, which he had no doubt was largely due to the unwillingness of responsible contractors to tender for the Council's work under the existing conditions of contract. In fact, the lowest tenderers stated that if the conditions were made similar to those of the Royal Institute of British Architects they would reduce their tender by about 5 per cent, or 250%. It was quite possible that other tenderers and persons who were deterred from tendering by the Council's conditions would reduce their estimates by an amount even greater than that. The committee further state that they had communicated with the manager of the Works Department, and had ascertained that his estimate for the work was 4,800%. They proposed at a subsequent date to recommend that the work should be entrusted to the manager, provided he was satisfied with the revised estimate submitted to him. The committee again recommended that none of the tenders should be accepted. After discussion, this course was agreed to at the meeting on Tuesday.

After a discussion on Mr. J. B. Piggitt's paper, "Some Improvements in Safety Lamps," on the proposition of the President, seconded by Mr. Treece, a vote of thanks was accorded the writer.

Mr. R. H. F. Hepplewhite read a paper entitled "Some Gases met with in Coal Mines." An interesting debate on the various properties and peculiarities of the gases most frequently met with in colliery workings ensued, in which Messrs. Hewitt, Hardy, Percy, Treece, Heald, Latham and Lodge took part. The further discussion was adjourned.

GREENWICH TUNNEL.

DURING the last session of Parliament the London County Council obtained powers to construct under the river at Greenwich a tunnel for foot passengers. The sum which the Council is authorised by the Act to expend on the work is 70,000%. When the matter was before Parliament certain compensation clauses were inserted, but the estimated cost was not altered to meet the varied circumstances. The bridges committee of the Council have now had an amended estimate of the cost submitted to them, and they are advised that it is necessary to provide for an increased sum of 30,000%. They accordingly communicated with the finance committee on the subject, and they have suggested that the carrying out of the scheme should be postponed until Parliament has sanctioned the further expenditure, as they have been advised by the Council's parliamentary agent that it would be more expedient to defer the work until the judgment of Parliament has been obtained on the increased estimate, and that the commencement of the work in the present circumstances involves at least the theoretical risk that large expenditure may be made and heavy liabilities incurred, while the Council has no statutory power to raise the money estimated as required to carry the work to its completion. The bridges committee state that the case is different from one in which, after the commencement and partial execution of the work, unforeseen difficulties occur, increasing the cost above the original estimate, and they point out that the matter does not permit of delay, as the inhabitants of Greenwich and the surrounding localities have pressed for a speedy completion of the work. Moreover, they do not think that the Council will be compromised if they proceed with so much of the work as will involve an expenditure not exceeding the sum mentioned in the Act, and in the meantime Par-

NOTTINGHAM SOCIETY OF JUNIOR ENGINEERS.

A MEETING of the above Society was held on the 13th inst. at the Nottingham University College. Mr. Charles Latham presided over a large attendance of members, including Messrs. H. R. Hewitt, H.M. Inspector of Mines; R. H. F. Hepplewhite, Awsworth; R. F. Percy, Nottingham; V. Greensmith, Newstead; Rigby, Stanton, Heald, Nottingham; and J. B. Piggitt, secretary.

The President, in his opening remarks, alluded to the loss which the mining community of the district was sustaining by Dr. Clowes leaving the college. Dr. Clowes had generously offered the Society the loan of his transactions of the Federated Institution of Engineers from the commencement to the present time, an offer which he (Mr. Latham) was going to supplement by the loan of his own transactions as they came out. Mr. R. F. Percy also offered the Society the four volumes of coal mining by André, thus forming the nucleus of a useful reference library for the members.

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact **it will Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION.

liamentary sanction can be obtained for the further amount of 30,000*l.* They have reason to believe that if the work were to be advertised at an early date, the cost would be less than if the carrying out of it were postponed until the latter part of next year. The further expenditure is, in their opinion, problematical, but it has to be provided in consequence of the action of Parliament in inserting the clauses for compensation to persons interested in the existing ferry rights and ferry.

SPELDHURST CHURCH.

ON Friday last Dr. Tristram, Q.C., as Chancellor of the Diocese of Canterbury, accompanied by Sir John Hassard, as registrar of the diocese, visited Speldhurst, four miles from Tunbridge Wells, and held a Court in the parish church there to hear a petition from the rector, the Rev. Donald Mackinnon, and the churchwardens for the building of a new vestry, arching over eight graves with concrete and with ventilation-chamber for the parish church, and for removing the central north aisle (memorial) window into the proposed new vestry. Speldhurst Church was destroyed by lightning in 1791, and the church which followed was entirely rebuilt in 1871 from designs by Sir Gilbert Scott, with the exception of the base of the old tower. The whole of the windows on the north and south sides of the church, with the exception of the memorial window referred to above, are from designs by Sir E. Burne-Jones, and the object of removing the memorial window is to introduce a final window by Sir E. Burne-Jones and to bring the whole church into harmony. Several witnesses were examined and the ground was carefully inspected by the Chancellor. The Court sat for two hours. The sum of 700*l.* is to be expended on the works.

THE LONDON BUILDING ACT.

THE London County Council have determined, upon the recommendation of the Building Act committee, to apply to Parliament next session for some important amendments in the London Building Act, 1894. In a report upon the matter the committee point out that recent decisions in the High Court as to the construction to be put upon certain sections of the Act are such as appear to render the working of the Act as it stands very difficult. The first point in which amendment is desired

is with reference to the procedure in the case of dangerous structures. Some delay appears to have occurred owing to a recent decision of one of the magistrates as to the service of the necessary summonses, in which he held that service by affixing a copy upon the premises was not sufficient unless the Council had, after some reasonable inquiry, failed to find the owner. The High Court, when applied to for a mandamus to the magistrate to hear the summons with which he had declined to proceed, decided that if the Council had made reasonable inquiry, and could not discover the owner, a summons could be served by affixing a copy on the premises, but discharged the mandamus on the technical ground that no evidence was given before the magistrate that such inquiry had been made. The committee think that that decision will put a serious difficulty in the way of proceedings, as it must involve in each case a search for documentary proof of the ownership of premises before a summons can be taken out, as without evidence of ownership—to get which evidence must, in many cases, be impossible—the case might be dismissed, with costs against the Council. They consider it essential that structures certified to be in a dangerous state should be dealt with with the utmost promptitude, and this will, they say, be impossible if such inquiries, which have never hitherto been required, have to be made. In illustration of the necessity for swift action, they state that only a very short time since, owing to a magistrate having refused to adjudicate upon a case in consequence of a point raised as to the service of the summonses, two men narrowly escaped being crushed through the falling down of part of a structure certified to be dangerous. The committee are of opinion that the section of the London Building Act dealing with the matter should be so amended as to make it clear that in all cases of dangerous structures all documents in proceedings may always be served on some person on the premises to whom such documents relate, or, if no person be found on the premises, by affixing such documents thereto. An amendment of section 14 of the Act is also to be asked for, in order to make it clear that no part of any new building shall be erected with its boundary fence or wall at less than the prescribed distance from the centre of the road. An amendment of another section is desired to make it clear that no working-class dwelling shall be erected within 20 feet from the centre of the street or way on which it abuts. Amendments are also to be asked for in relation to the clauses providing that penalties for certain offences under the Act can only be enforced when an order of the magistrates is not complied with.

METROPOLITAN WATER SUPPLY.

ON Monday, the 22nd inst., the Royal Commission appointed to inquire and report upon the water supply of the metropolis held their first sitting. The terms of reference are as follows:—"To inquire—(1) Whether, having regard to financial considerations and to present and prospective requirements as regards water supply in the districts within the limits of supply of the metropolitan water companies, it is desirable in the interests of the ratepayers and water consumers in those districts that the undertakings of the water companies should be acquired and managed either (a) by one authority, or (b) by several authorities, and, if so, what should be such authority or authorities; to what extent physical severance of the works and other property and sources of supply of the several companies, and the division thereof between different local authorities within the limits of supply are practicable and desirable; and what are the legal powers necessary to give effect to any such arrangements. (2) If the undertakings are not so acquired, whether additional powers of control should be exercised by local or other authorities; and, if so, what those powers should be. (3) Whether it is practicable to connect any two or more of the different systems of supply now administered by the eight metropolitan companies; and, if so, by whom, and in what proportion, should the cost of connecting them be borne, and what are the legal powers necessary to give effect to any such arrangement."

Lord Llandaff presided, and the other members of the Commission present were Sir John Dorington, M.P., Sir George Barclay Bruce, Mr. Alfred de Bock Porter, Major-General Alexander de Courcy Scott, Mr. H. W. Cripps, Q.C., and Mr. Robert Lewis, the only absentee being Mr. J. W. Mellor, Q.C., M.P. Mr. Cecil Owen attended in his capacity of secretary.

Mr. H. L. Cripps, the parliamentary agent of the London County Council, stated that he was cognisant of all the parliamentary proceedings of that body in relation to the water companies, and that he was fully acquainted with the views of the County Council upon the subject of the water supply of the metropolis.

The Chairman: Do you represent the views of the County Council?—I come here on their behalf and at their request to give to the Commission such information as they may think relevant to this matter. The views of the County Council as a corporate body are expressed in their own resolutions.

The Chairman: I gather that the Council are in favour of

solving the question of the metropolitan water supply by purchase of the existing undertakings?

Witness: Their views in that respect were embodied in the Bills submitted to Parliament in 1895 and 1897, upon which, however, there was considerable division of opinion. The latest decision of the Council upon the point was, first, that the undertakings of the companies should forthwith be purchased at a fair and reasonable value, regard being had to the rights, special circumstances and obligations of the company. A resolution to that effect was carried without a division after an amendment declaring that, since the purchase of the undertakings of the water companies would probably increase the cost of water to the public, the Council should not express an opinion in favour of purchase pending inquiry by the Royal Commission had been defeated by 53 to 37. In the alternative it was resolved, secondly, that the management of the water supply should be effected either by the London County Council supplying its own area directly and supplying the outside authorities with water in bulk at a fixed price; or, thirdly, that the London County Council should supply their own area, and that the outside bodies should supply their own areas. A fourth alternative recommending the establishment of a new body supplying the whole area, both within and without the county of London, was negatived. In view of the declared policy of Parliament and the example of other towns, a large majority on the County Council were in favour of immediate purchase, and they were fortified in that determination by the recommendations of the committees presided over by Sir William Harcourt and Sir Matthew White Ridley respectively. It was considered that mere regulation would not be at all likely to afford a final settlement of the question.

The Chairman: In the report of Sir William Harcourt's committee no preference is given to purchase over regulation, and, moreover, the view is expressed that a new water supply could be obtained at much less cost than the price that would have to be given for the existing water undertakings. I do not gather any declaration of the clear policy of Parliament in favour of purchase from the report of Sir William Harcourt's committee.

Witness: The clear policy of Parliament is expressed in nearly all the Water Acts which have been passed since 1880.

The Chairman: You allude, I presume, to the reservations which have been made in the event of purchase taking place?

Witness: I do. In the case of the Bills introduced by the water companies since 1880 the view taken by the committees

PRICE LIST AND ESTIMATES ON APPLICATION.

to which they have been referred has been that the water companies should not obtain to the full the powers for which they were asking, on the ground that such large additional powers might in their turn have to be the subject of purchase ultimately. Proceeding, witness pointed out that Sir Matthew White Ridley's committee proceeded from the outset on the assumption that there should be a single water authority for London, and, having regard to all the circumstances of the case, the County Council were of opinion that it would be fairer to the water companies to purchase their undertakings. The great difficulty of the County Council had been to get a hearing for its proposals. In 1895, for the first and only time, a definite scheme for the compulsory purchase of the London water companies was embodied in a Bill, to which a second reading was accorded by the House of Commons. That Bill went before a committee, of which Mr. David Plunket (now Lord Rathmore) was chairman, and although the Council were unable to get that Bill passed in consequence of a dissolution of Parliament, they felt assured from indications which fell from the committee from time to time, that they had satisfied that tribunal upon the question of purchase. As distinguished from provincial towns, there were special reasons why purchase was expedient and desirable in the case of London. In the first place, all the powers which the London water companies had obtained as the foundation of their present charters were obtained at a time previous to 1855, when no local authority existed which was competent to protect the consumers of water, whereas in the case of provincial towns there were the corporations and local boards. If there had been such an authority in London, probably the earlier statutes of the companies would have been very materially altered. The Metropolitan Board of Works had very limited powers, especially with regard to water, and it was not until 1888 that the London County Council was established.

The Chairman: Then you do not treat the Corporation of London as in any sense representing the county of London?

Witness: I regard the Corporation of London as a very important body, but it represents a comparatively small part of the administrative county of London from whichever point of view you regard it. For instance, it only represents about a 140th part of the resident population.

The Chairman: Do you suggest that the City is not really identical in interests with the rest of London?

Witness: The interests of the City are not only not identical

but adverse to the interests of the rest of London with regard to water supply because of the much greater rateable value of premises in the City as compared with the resident population.

The Chairman: I should have thought that would have made the City more anxious for a cheap water supply.

Witness: The policy of the City is to have a supply of water by meter so that they may only pay for the actual quantity which the population consumes, and not according to the rateable value as in the rest of London. Proceeding to give other special reasons in favour of purchase in the case of London, witness pointed out that London was supplied by eight different companies, whilst in all other cities and towns where the policy of purchase had been successfully carried out there had only been one company supplying the area, and that company having a practical monopoly, its position was quite clear and intelligible. In London, on the other hand, the confusion and difficulty arising from there being eight companies had always been very considerable. Then again, in London the rateable value of the premises supplied had outgrown the rateable value at the time when the water rates were originally fixed to a much larger extent than in provincial towns. Another special point was that in many provincial towns a large expenditure had been incurred in obtaining a water supply from a distant source, whereas in the case of London, although, undoubtedly, it would be necessary to obtain a supply from a distant source in the future, the expenditure at present incurred by the water companies was simply the expenditure involved in distributing the water of the Thames and the Lea. Nevertheless, the charges made for water in provincial towns were practically the same as or lower than in London. Then, with regard to the system of departmental control, the audit of the accounts of the London water companies was conducted by an auditor paid by the companies, whose power of enforcing his decisions was limited by the obligation to pay the cost of any legal proceedings out of his own salary. In London, again, the burden of the water rates fell more heavily upon the occupiers of the smaller houses than upon the richer classes. Elsewhere, too, the water companies were under obligation to supply water up to the topmost storeys of the houses, and, owing to special exemptions which were granted to some of the metropolitan water companies, there were some portions of London in which the inhabitants, almost alone amongst civilised communities, had no means of getting water supplied to the tops of their houses. Analysing the published accounts of the London water companies, witness

pointed out that whereas in 1895 the net profits available for distribution were 838,000*l.*, the amount actually divided was 913,000*l.*, which was accounted for by the fact that the credit balance carried forward at the end of the year was less than in the previous one. The net profit available for dividend by the eight companies in 1896, upon an ordinary capital of 10,288,410*l.* was 952,000*l.*, but inasmuch as it was provided for the first time in 1894 that additional capital should be raised by the issue of stock redeemable in twenty-five years, the companies would be precluded from claiming anything in respect of this extra capital in case of purchase. The immense cost of the parliamentary proceedings, both on the part of the Council and the companies, would also be saved in the case of purchase, but in addition to the maximum dividends there would be a claim for back dividends, except in the case of the West Middlesex, who had already paid off their back dividends, and in the case of the Kent and Chelsea companies, who were in course of paying them off. The probability of the other companies ever arriving at that stage was too remote to be worth considering.

The Commission adjourned until Monday, December 6.

HISTORY OF MUNICIPAL ENGINEERS.

At the first sessional meeting of the Gloucestershire Engineering Society the president, Mr. R. Read, city surveyor, read a paper on "Municipal Engineering."

In the course of his address, according to the *Gloucestershire Chronicle*, Mr. Read said the history of municipal engineering was bound up with that of the growth of towns during the century now drawing to a close, and more especially with that of the wonderful development of the last sixty years. A century ago the population of the rural districts exceeded that of the towns, but now the total population of the towns was two and a half times that of the country. The growth commenced with the improvement of the steam-engine by James Watt, improvements in spinning machinery by Hargreaves and Arkwright, and of weaving machinery by Jacquard. The results which followed were a rush to the towns and great commercial progress, accompanied by overcrowding, drink, dirt and disease. In 1839, in consequence of reports by Drs. Arnot, Kay and South-

wood Smith to the Poor Law Commissioners in reference to the poor in the East End of London, a Royal Commission was appointed to inquire into the sanitary condition of the labouring classes throughout England and Wales, and afterwards Scotland. They presented their report in 1842. The report showed that in 1838 56,000 people died from epidemic diseases in England and Wales, and that in Liverpool nearly 40,000 persons lived in 8,000 cellars below the street level, nearly 3,000 of which were stated to be wet and filthy, and the other large towns were in a similar condition. Epidemics of cholera and typhus were of frequent occurrence, there being no organised system of drainage or water supply in the towns. The sanitary laws were badly administered by the poor-law guardians or the overseers of the parishes, but in London commissioners of sewers had recently been appointed. The general death-rate in towns ranged from 30 to 50 per 1,000, and in Manchester 57 per cent. of the children born died before they attained the age of five years, and "the average duration of life of mechanics, labourers and their families was seventeen years; tradesmen and their families, twenty years; professional persons and the gentry and their families, thirty-eight years." In Liverpool 1 in 25 of the population was said to be annually attacked with fever of some kind or another. In 1838 throughout England and Wales 43,000 widows and 112,000 children were relieved by the guardians of the poor, the husbands and fathers having all died under the age of forty-five years. The roads and footpaths were neglected, scavenging was left to the dogs, or when it was contracted for the contractors seldom carried out their contracts; the water supply was derived either from polluted streams or surface wells generally in close proximity to cesspools; the cesspools were leaky and seldom emptied, and the slops thrown into the streets, and the condition of towns generally was deplorable. The result of the report of the Royal Commission was the Public Health Act, 1848, which was drafted after considerable labour and the investigation of evidence from doctors and all kinds of people, including that of Mr. John Rowe, who was the surveyor of the parish of Finsbury, in London, the inventor of the egg-shaped section of sewers. Under the powers of that Act a general board of health was established in London, with Mr. Austin, C.E., as its chief engineering adviser, and corporations were made local boards of health, with power to appoint fit and proper persons to act as surveyors. This created a demand for a class of men who did not exist, and a very curious lot of appointments were made; amongst others a bankrupt draper of his native town on the ground that he was "accustomed

to measuring." A great many towns were sewered under the powers of that Act, Gloucester being amongst the number in 1852. Mr. Read gave a description of the sewers which were then in use, and also the part which the members of the Institution of Civil Engineers took in the matter, and remarked that at the present time the majority of surveyors of large towns were civil engineers by profession. He went on to say that the duties of a municipal engineer were very varied. He had first of all to make himself acquainted with his town or district, its physical, geological and meteorological conditions. As regarded the roads and footways, he had to consider the local materials which might be available for their construction or repairs, and failing these, to select the most suitable and economical materials from other places. In the old times, when each owner of property built according to his own sweet will, each trying to come beyond his neighbour, some would aspire to build high above ground, and others, less ambitious or more economical, would keep the floors below the levels of the streets. All old towns suffered to this day from these irregularities of line and level, and in many cases the one side of a street would be found much lower than the other for no apparent reason than the vagaries of the builders of a past generation. In constructing the carriage-way of a street its real stability depended upon its foundation. The materials with which the surface was finished varied with the kind of traffic it had to bear, and might be either hard broken stone, familiarly known as macadam, granite or other stone setts, wood blocks or asphalt, while in America bricks were being used. Macadam was the cheapest in first cost, but the most expensive in maintenance. Stone setts were most expensive in first cost, but the cheapest in maintenance. The old idea that the streets of London and other large towns were paved with gold was now almost literally true, for miles of them had cost at least 1*l.* per square yard to construct, and yet the cyclist was not happy or satisfied. The smoother and better a road was for traction the worse foothold it gave to horses, and these two requirements were so opposed to each other that it appeared to him (Mr. Read) that a perfect road from a cyclist's point of view could only be obtained after an improved method of shoeing horses had been discovered to enable them to draw loads on a perfectly smooth road, or horses would have to be superseded by motor cars. Mr. Read went on to describe the construction of footways and scavenging and cleansing operations, and contrasted the present system with that of the olden times, when the

system of sewerage was adopted to avoid the expense of sewers. He said that in designing a system of sewers for a town, the municipal engineer was faced with a very complicated problem. The system in general use might be divided into two classes: first, the combined system, which took both sewage and rain-fall; and, secondly, the separate system, which might be again subdivided into two methods—(1) which provided two distinct sets of sewers, one for foul water and the other for rain water, and (2) a small single system of sewers, upon which the flood water was allowed to overflow weirs placed at intervals in the sewers down other natural channels or brooks into the rivers. As long as sewage was delivered straight into the rivers, whether tidal or not, there was no necessity for separating the rain water from the sewage, but when the sewage had to be dealt with and purified before the effluent was allowed to go into the river, then the question of quantity became very important, especially when, as was generally the case, the whole of the sewage had to be pumped in order to deal with it. He proceeded to say that the difficulties which surrounded the subject of sewerage and its disposal were not only scientific but legal, and the sewage and drainage system of a town was necessarily the growth of years, and was seldom carried out on one complete system or by one individual. After describing the experiments which have been made in the disposal of sewage matter, Mr. Read passed on to the consideration of the water supply. He said that it was clear that the water-carriage system could not be carried out without an abundant water supply under pressure, and this necessitated the bringing in of a supply from a distance or pumping and purification of river water, or the sinking of wells, which of course again entailed pumping. Originally the supplies for most towns were taken from rivers, London being the chief example of this method; in fact, the rivers mainly determined the position of the towns. These supplies were usually in the hands of companies, there being eight separate companies supplying London from the River Thames and Lea. As London increased the intakes of the water companies were shifted higher up the river, most of them now being above Hampton and Kingston. As the rivers became more and more polluted new supplies were looked for upon any available high ground within reasonable distance from the town, and as these were not always obtainable many of the larger towns have had to go very long distances for their water supply, notably Glasgow 30 miles, to Loch Katrine, Manchester to Thirlmere, in Cumberland, about 120 miles, Liverpool to head waters of the Severn at

AGENTS APPOINTED IN ALL LARGE TOWNS.

Vyrnwy, and Birmingham, the latest example, to the head waters of the Wye in North Wales. Some of these works have cost from 6,000,000*l.* to 8,000,000*l.* Water from the hills is simply impounded by throwing a watertight bank of clay across the narrowest part of the valley, thus forming an artificial lake; and from thence conveying it in pipes by gravitation to the towns. Next to impounding, pumping from a river was the least expensive, but as a river naturally drains a large extent of country more or less thickly inhabited, the waters of a river are always more or less polluted, and great expense has always to be gone to deal with the water before use; or it might be necessary to go so far up the river that the cost equals the third method—that of sinking wells—the most costly of all, as the well has to be sunk either throughout the whole or a greater part of its depth in the water-bearing strata, and large temporary pumping plant sufficient to deal with the maximum quantity of water has to be kept continually working while the well was being sunk, and when this is finished the well-water might or not require filtering according to the circumstances and position in which the well is sunk. It had also to be pumped out of the well into a reservoir on high ground in order to obtain sufficient pressure. The Witcomb supply was an example of the impounding and gravitation method, and the Newent supply of that from the wells. A vast improvement in the health of town populations had resulted from the vast works which have been executed, as now the general death-rate of the United Kingdom had been reduced to 18 per 1,000, and the zymotic death-rate to $2\frac{1}{4}$ per 1,000. In addition to the duty of designing, executing and maintaining works which he had mentioned, a municipal engineer had to lay out parks, cemeteries, markets, &c., and to advise the Corporation on such questions as acquiring gasworks and tramways, and lately he had to make himself familiar with the latest developments of refuse-destructors and electric-lighting plant. The furnace for the destruction of dust or house-refuse was a comparatively modern development of corporation work on behalf of the individual, who could easily dispose of the bulk of his house refuse in the kitchen fire if it was done daily. The earlier furnaces were designed merely to get rid of the refuse, but the more recent forms use the heat generated by raising steam for various purposes, chiefly for producing electric light. Taking a low estimate of the value of the refuse 1 lb. would evaporate 1 lb. of water into steam, which meant that the house refuse of Gloucester was equal to producing from 100 to 180 horse-power available for electrical lighting or other

purposes. Mr. Read concluded an interesting address by saying that in future there was no doubt that the duties of a municipal engineer might be further extended, as the tendency of the age was, like *Oliver Twist*, to still ask for more, and the duty of satisfying these requirements devolved more and more upon public authorities, and the State in preference to individuals, but as long as this work is carried out in obedience to the natural laws so long will it be successful, and the great source of power in nature be converted, adapted and applied for the use and convenience of man.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

26092. Peter Arthur Tofft, for "Improvements in portable houses."

26093. Frances May Hamilton and Carleton Gilbert, for "Improvements in firebox partitions for cooking-stoves and ranges."

23168. John Holmes Sutton, for "Improvements in or connected with pipes and pipe joints."

26258. Charles Greenhalgh, for "Improvements in or applicable to waste water-closets."

26262. John Johnston Green and Charles Leslie Stiff, for "A new and improved method of forming the joints in earthenware and other pipes."

26443. Florimond Dumay, for "Improvements in or relating to earth closets."

26450. Joseph Hall, for "Improvements in stoneware and metal pipe-joints."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{3}{16}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

THE EXPANDED METAL COMPANY, LTD.

39 UPPER THAMES STREET, LONDON, E.C.

members of the Institution to the Company for their kindness in affording year after year the use of their fine hall, and in giving them a substantial annual donation. The Company were also to be congratulated on the excellent technical work they were doing in connection with the building and kindred trades.

Mr. J. C. Preston (senior warden) returned thanks. The Company were always glad to lend their hall for such a purpose as this, and it was a pleasure to see around him gentlemen whose names had been household words to many of them for years past.

Mr. T. F. Rider proposed the toast of "The President" in his usual humorous manner. The President of an institution like this, he contended, should be a genial man, a jovial man and a generous man. Everyone, he believed, would admit the geniality of the President, they acknowledged his joviality, and they could all bear testimony to his generosity. It was unnecessary to add a single word to commend this toast.

The toast was very cordially received.

The President, in replying, said he considered it a privilege to be at the head of an Institution like this, and he hoped that as time went on the younger builders would be encouraged to do what they could for the Institution. He could not sit down without referring to the good work that Mr. George Plucknett (the treasurer), who was prevented from being present, had for so long done for the Institution.

Mr. J. Howard Colls, in proposing "The Architects and Surveyors," said that in his opinion the two bodies should be as distinct as possible. If there was anything worse than architects' quantities it was quantity surveyors' architecture.

Mr. W. B. Church, in replying for the architects, said that they always endeavoured to do what was right as between client and builder. An architect's position nowadays was not altogether a bed of roses, for with so many new materials and new ideas he had to be a sort of walking encyclopædia.

Mr. Northcroft replied for the surveyors, and referred to the fact that linendrapers and upholsterers now dubbed themselves builders. If a man liked to be a retail tradesman, he had every right to sell laces behind his counter, but he had no business to interfere with the legitimate trade of a builder, and too often with the unfortunate results he had sometimes met with in his experience.

Mr. H. Holloway gave the last toast, "The Vice-Presidents, Committee and Stewards," which was replied to by Mr. Ritchie for the vice-presidents, and Mr. J. T. Bolding for the committee and the stewards.

In the course of the evening Major Brutton announced the list of subscriptions, which showed total donations amounting to 741*l.*, with 12*s.* of new annual subscriptions. The President's list showed a total of 599*l.* 14*s.*, including a donation of 100 guineas from the President himself.

An excellent programme was performed by students of the Guildhall School of Music.

THE CRIPPLEGATE FIRE.

THE City of London, under a special Act of Parliament, possesses the power to hold what is described as a fire inquest on the occasion of the outbreak of any large conflagration, and the City coroner (Mr. Langham) proposes to exercise this right at the Guildhall, on Monday, at 11.30, in connection with the recent disastrous fire in Cripplegate. The coroner, acting under this Act, has absolute power to prosecute full inquiries into the cause of any outbreak, the means taken for its extinction and the methods which may be taken for the prevention of a similar occurrence. Several fire inquests have been held within the City, it being the revival of an old civic custom which had long prevailed in the interests of the citizens. The City coroner decides whether the fire inquest shall be held or not, unless he is required to do so by the Lord Mayor of the City, the Lord Chief Justice of England or by one of Her Majesty's principal Secretaries of State. The importance and rapid development of the recent great conflagration leave no doubt as to the desirability of a public inquiry in the interests of all concerned. It may not be generally known that the coroner at a fire inquest possesses similar powers to those exercised by a coroner investigating a cause of death. If evidence is given pointing to arson the coroner's jury can return a verdict to that effect, while if the persons implicated are present they can be arrested on the coroner's warrant. If they are not present warrants may be issued against them, and they may be prosecuted at the Mansion House or Guildhall Police Courts. In the present instance the City solicitor (Mr. H. Homewood Crawford) has been specially instructed to represent the Corporation and the Commissioner of City Police (Sir Henry Smith, K.C.B.), while evidence will be given by Commander Wells (the chief of the Metropolitan Fire Brigade), Major Fox (the chief officer of the London Salvage Corps), and by many other witnesses, including some of those whose business premises have been destroyed.

ANNAN ENGINEERING WORKS.

For some time negotiations have been in progress between Messrs. Cochran & Co., engineers and ironfounders, of Birkenhead, and the representatives of Mr. Mackenzie, of Newbie, for a site at Annan to establish engineering works on a large scale. The negotiations have now, it is understood, been all satisfactorily arranged and settled as between the firm and the proprietor of Newbie estate. Messrs. Cochran & Co. have decided to remove their entire works from Birkenhead to Annan. The site selected is practically the harbour at the mouth of the river Annan, and opens right into the Solway Firth. The land marked out for the works extends to 13½ acres, and lies on the west side of the river. During the high tides iron ships of large tonnage can be launched and floated. A railway siding at present connects the projected works, and joins the main line of the Glasgow and South-Western Railway at a point half a mile to the west of the railway station at Annan. Ships of medium tonnage can at present load and discharge opposite the site of the proposed ironworks. The Board of Trade have just granted powers to the harbour trustees to convert the harbour into a public port. The establishing of large ironworks and shipbuilding will undoubtedly cause a large development of trade between larger towns in England and the south of Scotland. At present the firm employ some hundreds of engineers at Birkenhead, and it is their intention to further increase their business at Annan and employ a larger staff. Two hundred dwelling-houses are to be immediately erected at the works for the accommodation of the employes of the firm. It is understood that the works have to be pushed forward with all haste.

THE MANCHESTER CULVERT SCHEME.

At the opening meeting of the Manchester Association of Students, in connection with the Institute of Civil Engineers, the president, Mr. W. B. Worthington, chief engineer of the Lancashire and Yorkshire Railway, delivered his inaugural address, in which he discussed the subject of design in relation to maintenance. He pointed out that in designing a structure the engineer must comply with three conditions, first, that the structure should be strong enough to fulfil the purpose for which it was intended; secondly, that it must be capable of being maintained in good order by the class of labour and with the

material and appliances available at a reasonable expense; and thirdly, it must be constructed at the minimum cost consistently with fulfilling the two conditions already laid down, and any other special conditions that might be imposed. The second of the three conditions, he urged, was of the greatest importance, and could not be too often or too strongly insisted upon. The disregard of it arose from two main causes—ignorance of maintenance requirements and desire to save first cost. They had in the city of Manchester a remarkable illustration of the points he desired to make. The rivers committee of the Corporation, who had for a long time past anxiously considered the matter in all its bearings, advised by the city surveyor and supported by practically the whole Council, decided that the sewage of Manchester could be more economically and satisfactorily dealt with by means of a culvert to carry off the effluent from the sewage works to the tidal waters of the Mersey estuary than by treating the sewage at the sewage works in such a manner as to produce an effluent which would satisfy the requirements of the Mersey and Irwell joint committee, and discharging that effluent into the Ship Canal. The whole matter practically turned upon the maintenance question. The Council having all the facts before them and having, by their committee, gone fully into the first cost and cost of maintenance of the rival schemes, decided that it would be cheapest and best for the city to take the effluent to the sea. The citizens, when called upon to vote in confirmation of that, had gone contrary to the opinion of their representatives and skilled advisers, and had done so, no doubt, in part owing to the mass of voters not being sufficiently informed on the merits to appreciate the importance of the second consideration which he had put forward, which required that the work should be able to be maintained at a reasonable cost. They understood that the culvert scheme involved a large initial outlay, and in seeking to avoid that they overlooked the fact that it would, if carried out, save their pockets by relieving them of the necessity of the heavy annual outlay which the alternative scheme involved.

FASHIONABLE Folkestone is very indignant at the proposal of two distinct companies to run electric trams along the main thoroughfares of the town and district. The adjoining towns of Sandgate, Hythe and Cheriton are all in favour of the scheme, which also finds support from the middle classes in Folkestone.

PETRIFITE.

WE have in a recent number given a full report of a paper that was read before the Architectural Association by Mr. H. D. Searles-Wood, F.R.I.B.A., past president, and subsequently discussed by members who were present. We are reminded that at one of our building exhibitions we were interested and surprised at specimens that were then brought under our notice, and we have been waiting to see the invention brought out on mercantile lines, for a delay not unnaturally suggests that there are practical difficulties still to be overcome.

However, from facts that have been put before us from a reliable source we are satisfied that the proprietors have exercised a wise discretion in not "rushing" the business, as the delay has enabled them to secure an additional 4,000 acres of rich magnesite mines with an almost inexhaustible supply. The petrified cement in our opinion (which, of course, is largely based upon the reliable test of Messrs. Kirkaldy & Sons, published *in extenso* in ours of November 13) is likely to be of great value in utilising waste products; in other words, converting what is now an expense and a nuisance into a saleable and valuable manufacture. We have just seen a convincing illustration of this in connection with the plate and glass manufacture. The sand used by one firm in the North every week necessitates 500 tons to be carted or barged away at a heavy cost, and will probably by means of petrified be converted into a valuable building stone that will command a good price. As in this same town there are not less than 2,000 tons weekly to be thus dealt with, the introduction of petrified promises to be a great boon to this cognate manufacture. We are informed that a strong company is now being formed to manufacture and otherwise develop this new industry. During this and the next week specimens will be exhibited at 10 Walbrook, indicating what has already been effected by petrified with unwashed sea-sand, common earth, sawdust, slag, slate and brick *débris* and town refuse.

BIRMINGHAM MASTER BUILDERS' ASSOCIATION.

THE annual meeting of the Birmingham Master Builders' Association was held on the 25th ult. at the Grand Hotel; Mr. B. Whitehouse presided. The committee, in their report for 1897, said they were pleased to record the continuance of the improvement in the general state of trade of the country referred to in their last report. The building trade had to some extent

participated in that improvement; but contractors had been seriously handicapped by the increased prices of all materials. In November last notices were received for alterations in the rules from the carpenters, bricklayers, masons, plumbers, plasterers and labourers, the labourers being the only branch asking for an increase in wages. A general meeting of employers and operatives was held on January 13, to endeavour to make the notices received as to hours of work and pay-time uniform. That end was practically attained, and it was strongly felt that uniformity on those two points was imperative. Notices had again been received from the carpenters, masons, plasterers, plumbers and labourers, asking for alterations of rules and a considerable advance of wages. These notices would receive the careful consideration of the committee. The Workmen's Compensation Act would throw serious responsibilities on employers, and a circular would be issued to architects suggesting the addition to bills of quantities of a clause making provision to cover the enormous risks incurred by contractors under the Act which will come into force next year. The balance-sheet showed total receipts for the year 130*l.* 4*s.* 6*d.*, which, with the balance from last year, made a total of 270*l.* 3*s.* 7*d.*; and the various disbursements, including secretary's salary, were 117*l.* 7*s.*, leaving a sum of 152*l.* 16*s.* 7*d.* to the credit of the Association.

In moving the adoption of the report and balance-sheet, the Chairman said they had reason for congratulating themselves that the increased trade had kept up, and it was a source of pleasure to know the workmen had been fully employed. While they had endeavoured, on their part, to meet the demands made upon them by architects and clients, they had not only been seriously handicapped by the increased price of all materials, but by the difficulty in obtaining those materials. This had caused delay, and had made it next to impossible for them to calculate how long a job would take or to give an approximate estimate of the cost. The operatives and themselves had met and fully discussed the rules, and they really thought they had settled them for a considerable time. It seemed a pity that after having thrashed out most of the points as they did in the spring of this year they should come up again for further discussion. Whatever was said at the beginning of the year applied now, and he regretted that until the whole of the branches were unanimous in having one pay-time and one working-time, they should have been asked to reconsider the matter piecemeal. Referring to the Workmen's Compensation Act, he said that

draw and durability.

personally he thought it was unjust in principle to the employers and the employed. In the first place, it threw the liability on employers for accidents over which they had no control; and, secondly, it pauperised the workmen, instead of encouraging them to thrift, because it promised them something for nothing. Under the provisions of the Act the employers might find themselves, after making every provision as far as insurance went, practically ruined, for the reason that an accident might occur that would disable a number of men to whom a legacy would have to be paid of 17. weekly. In the case of death there was a minimum compensation of 150%, which might be increased to 300%. He considered it wrong that the workmen should not be asked to contribute to an insurance fund. What the Government might have done was to have formed a national insurance company, to which employers should contribute, and to which the workmen should also pay a moiety, and not place the whole of the liability on the employer. It was a matter which deserved their consideration; and although the Act would come into force next year, and they would have to bow to it, he thought the time would come when it would have to be replaced by something more just, or swept away.

Mr. C. H. Barnsley seconded the motion, which was carried. On the proposition of the Chairman, seconded by Mr. Albert Smith, County Alderman J. Bowen was elected president for the ensuing year. Mr. F. G. Whittall was elected vice-president; Mr. G. Twigg, treasurer; Mr. E. J. Bigwood, secretary; and Messrs. T. Johnson and J. S. Surman, auditors.

Mr. Newell proposed "That the notices received from the various branches of the operatives be left in the hands of the committee to deal with."

Mr. Trentham seconded the resolution, which was carried without discussion.

Votes of thanks were passed to the retiring president and to Alderman Bowen.

THE closing services prior to the dismantling of the church were held on Sunday in Christ Church, New Street, Birmingham. The church is the only one in the city which is connected with the central telephonic exchanges, and not only was the church crowded, but all the wires connected with the church were in use for the benefit of subscribers who were unable to attend.

BUILDING AND BUILDERS.

A WOLVERHAMPTON builder has had to pay 187. 4s. fines and costs for not properly bonding the walls of two small houses.

THE new female seminary at Washington, Pa., has been designed by Miss Elsie Mercur, of Pittsburgh. The contractor is also a woman, Mrs. Clara Meade, of Chicago. There will be a lively time, says the *Canadian Architect*, when women also invade the ranks of the trades unions.

THE foundation-stone of the Goldfields Cathedral, which is to be erected at Coolgardie, was laid on Tuesday last with Masonic honours by Sir Gerard Smith, Governor of Western Australia.

THE Rev. J. Whiteside, vicar of Shap, Westmorland, has applied at the Carlisle Consistory Court for a faculty for the restoration of his church. It was stated that the cost of the work proposed to be done was estimated at 2,500l. to 2,700l.

THE foundation-stone was laid on Monday last of the new Primitive Methodist church and Sunday school in Crystal Palace Road, East Dulwich. The buildings, which will be in the centre of a dense working-class population, will accommodate 300 worshippers and the same number of Sunday-school children. The cost is estimated at 2,100l.

ON Monday afternoon Jeremiah Makinson, builder, of Leigh, and three of his men, Thomas Balmer, William Cleworth and John Langhorn, whilst winding up a girder at Peter's Corn Mill, Glazebury, accidentally caught another girder, weighing 7 cwt., which dropped upon them from the height of 10 feet. Makinson's back was injured, Balmer had his back cut, and all four were badly bruised and scarred.

THE memorial-stone of a new church which is being erected at the corner of Lawrence Street and Alexandra Street, Partick, for the congregation of the East U.P. church, was laid last Saturday. The style of the architecture of the building is thirteenth-century Gothic, with generally massive treatment and simple and severe detail. The central feature of the front is a lofty gable with broad buttresses at each side. A central buttress of lesser projection divides the gable, and in the lower portion are two four-light windows under the arches which spring from the buttresses on each side. Over these are two large triplet windows with cusped heads, occupying the whole space between the buttresses, and recessed under deeply moulded pointed arches. The apex of the gable, which rises over 70 feet above the street, is enriched with a moulded

niche and terminates in a foliated cross. A projecting porch at the south-east corner of the building forms the main entrance, and is more elaborately treated in detail, a very richly moulded archway giving access to the wide double doors which open into the inner vestibule. On the west side of the main gable is another doorway, which also forms the hall entrance, and between this and the hall gable, which fronts Lawrence Street, is an octagonal turret, quite plain in the lower portion, and with a series of traceried windows in the upper stage, forming the gallery and hall staircase. The halls and accessory-rooms are placed to the west side of the church, but are so arranged that independent use may be made of either, and are accessible from both streets. The side elevations of the church show a series of low four-light windows with square heads in the lower stage, and in each bay over these, divided by broad piers, are tall two-light windows of lancet shape, with moulded and cusped heads. The organ-chamber is projected in the chancel form to the north, and at the southern end is a tall narrow gable containing the gallery staircase. Internally the same massive and severe treatment is proposed. The nave is divided from the aisles by stone piers, one only on each side, springing from which are moulded arches of wide span. The stone piers are simply splayed, the gallery beams resting on projecting stone corbels, and the inner angles of the piers are carried up to the roof and form rests for the main roof timbers. The principal roof timbers will be shown, and the ceilings will be lined with wood panelling. The number of sittings provided is 840, and there are also halls for 400 and 200, classrooms, ladies' room, vestry, kitchen, &c. The total cost will be about 7,500*l.*, and it is hoped to open the church by next autumn. The architect is Mr. John B. Wilson, Glasgow.

SERIOUS subsidences are taking place in the township of Kinsley owing to the place being undermined through the operations of the new Hemsworth Colliery Company in working what is known as the Shafton Pit. The matter was reported at the meeting of the Hemsworth District Council a month ago, when it was stated that up to that time seventeen or eighteen houses had been rendered uninhabitable through the collapsing of the land, and that the whole drainage system was disorganised owing to the houses having sunk below the drains, and since then the damage is said to have considerably extended.

TRADE NOTES.

THE extension to the Toxteth Union Infirmary, Liverpool, is being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves with descending smoke flues, those previously supplied having given every satisfaction.

THE Reliance Lubricating Oil Company, of Water Lane, Great Tower Street, have sent us their price-list of engine and machinery oils for lubricating every kind of machinery from the typewriter to the locomotive or marine engine. The firm also supply illuminating oils, solidified oil for patent spring lubricators, belt syrup for softening driving belts and keeping them in good condition, &c.

A LARGE window has lately been placed in Slébech Church as a memorial to the late Miss Philipps, daughter of Sir Charles E. G. Philipps, of Picton Castle, Haverfordwest. Sir Charles Philipps has also beautified the large hall of Picton Castle by four large stained-glass heraldic windows, containing the family pedigree from the eleventh century to the present time, arranged by Sir Albert Woods, C.B., K.C.M.G. The whole of these works were executed by the well-known firm of Alexander Gibbs & Co., 10 Bloomsbury Street, London.

THE parish church of Hartlebury, near Kidderminster, has been recently enriched by the addition of two carved oak screens for the chancel aisle. They are executed in Austrian oak with traceried and carved panels, surmounted by a pierced cresting in the Late Decorated style of architecture. In the centre of one screen the royal coat-of-arms is tastefully carved on a ribbon as follows:—"To commemorate the Diamond Jubilee of Queen Victoria, this organ is offered for the service of Almighty God by the parishioners, June 20, 1897." The work was entrusted to Messrs. Jones & Willis, of Birmingham and London, who executed it in the most artistic manner.

VARIETIES.

THE Council of the Iron and Steel Institute have accepted an invitation from the Association of Swedish Ironmasters to hold the autumn meeting of the Institute next year in Stockholm. The meeting will be held in August.

HER ROYAL HIGHNESS PRINCESS LOUISE, accompanied by the Marquis of Lorne, visited Paisley on Tuesday last, and, after formally opening the Brough Home for Nurses in Oakshaw, laid the memorial-stone of the new technical school in George Street.

MR. H. BUSHELL, F.S.I., read a paper before the Auctioneers' Institute last Tuesday on "The Practical Application of the Principles and Law of Dilapidations."

TOWARDS the widening of Westbourne Park Bridge the works committee of the Paddington Vestry recommend the latter to contribute a third of the 17,628*l.* estimated as required, providing the London County Council and the railways concerned defray the remaining two-thirds.

THE Nottingham Master Builders' Association have now permanent offices at Bentinck Buildings, Wheeler Gate, with a room set apart as committee and reading room, and are forming a library of books connected with trade matters and also of catalogues and price lists, &c., of all-goods, appliances, &c., used by the building trades.

THE Dudfield Memorial Hall and classrooms connected with the Lansdowne Place Ragged School and Mission, Tabard Street, New Kent Road, were opened on the 29th ult. The new buildings, erected at a cost of 1,000*l.*, consist of the hall, capable of holding 150 adults; an infants' room, to accommodate 200; and classrooms, capable of holding 100 adults.

THE new Lyric Hall, Belfast, was opened on the 26th ult., and highly favourable opinions were expressed by the large and fashionable audience which attended the inaugural concert. The hall is constructed to seat 1,500. The front portion of the area is fitted with handsomely upholstered armchairs. Behind this portion is the area, fitted with backed seats. An important point in the construction of the ground plan is the width of the side passages, which is ample to give easy access to the seats. The private boxes and balcony stalls are tastefully and comfortably decorated, and the ventilation is good.

AT a recent meeting of the directors of the Edinburgh Building Trades' Exchange the following motion was submitted:—"It being currently reported in building circles that

the estimates for the work at the New Royal Infirmary Pavilion have not been settled in a satisfactory manner, the directors of the Exchange take up the matter, and instruct their secretary to communicate with the secretary of the Infirmary, and ask him, for the satisfaction of the building trades, to forthwith publish a list of the estimates received."

DURING the thunderstorm on Sunday the tower of All Saints' Church, Nottingham, was struck by lightning. Big blocks of stone fell on the lawn of the vicarage, while others were thrown inside the church. Fortunately the service was over, and the church was closed.

IT has been resolved at a special meeting of the Workington Town Council to contribute 100,000*l.* towards the cost of the construction of a new deep-water dock on the south side of the existing harbour. Lord Lonsdale's interests are to be bought out, and traders connected with Cammell's, Moss Bay, Lowther and Workington hematite works are pledged to contribute not less than 75,000*l.* The estimated cost of the dock is 300,000*l.* A Bill will be deposited in the next session of Parliament and a public meeting of ratepayers will be held to confirm the Council's unanimous decision.

THE Duchess of Beaufort on Monday cut the first sod of the South Wales and Bristol Direct Railway, which the Great Western Company are constructing to shorten the distance between London and Newport. The new line will be 33 miles long, extending from Wootton Bassett, through Wilts and Gloucestershire, and the heart of the Badminton hunting country to Filton, where it connects with the Severn Tunnel Branch. It will cost a million sterling, and take 3½ years to construct. It will reduce the journey from London to Newport, *via* Bath and Bristol, by 11 miles, or *via* Gloucester by 26 miles. The ceremony took place at Chipping Sodbury, an old-fashioned Gloucestershire town.

THE work of reconstruction of Highgate Archway has now commenced. Several loads of timber have been placed on the Islington and London side, and stout piles have been erected on the Hornsey and Middlesex side. A temporary building has been erected at the Highgate end, and workmen will at once begin a difficult part of the work, diverting the mains of the New River Company. The footway will be maintained on the north side during the construction of the southern half, and a temporary footway will be formed on the south side while the northern position is being removed. Vehicular traffic will have to be diverted, but the date is not known when it will be stopped.

ELECTRIC NOTES.

A SYNDICATE has been formed to promote the construction of an electric railway to the highest level of the Great Orme, and Mr. Enfield Taylor, engineer, Chester, at a special meeting of the Llandudno District Council, submitted plans for the proposed scheme. It is suggested that the line start from the site now occupied by the old Victoria Hotel, in Church Walks, and proceed along the road to St. Tudno Church, crossing some fields to the right of the church to a terminus not far from the old telegraph station and the Great Orme Lighthouse. The Council approved the scheme, with only one dissentient. Mr. Taylor said that the syndicate intended applying to Parliament for powers next session, and if obtained the company would be formed at once.

At the adjourned special meeting of the Huyton-with-Roby District Council, held on the 29th ult., the question of electric light for the district was again considered, and it was resolved that the Council should apply for a provisional order and that they endeavour to come to terms with the British Insulated Wire Company, with a view to withdrawing all opposition to the wire company's application for a provisional order.

At a special meeting of the Hereford Town Council it was decided that it was expedient that the Council apply to the Board of Trade for a provisional order under the Electric Lighting Acts 1882 and 1888, authorising them to supply electricity for all public and private purposes within the city. In the course of the discussion it was stated that the Council had no immediate intention of supplying the electric light, and the object of obtaining the order was to prevent any outside company stepping in. The resolution was carried unanimously. It was also decided that it be referred to the finance committee to prepare an estimate of the amount of capital required in connection with the undertaking.

ON Tuesday last Mr. Frederick H. Tulloch held an inquiry at Llandudno, on behalf of the Local Government Board, into an application by the Llandudno Urban District Council for powers to borrow a sum of 25,000*l.* for the erection of electric-lighting works and the provision of an electric refuse destructor. Mr. A. H. Preece, the engineer, explained the details of the electric-lighting works, which it was intended to erect near the present gasworks. The system to be adopted was that known as the three-wire system, and the scheme had been approved of by the Board of Trade. It was proposed to place thirty arc-lights on the promenade, extending as far as Penrhyn Crossing,

and twenty other arc lights in Mostyn Street and the streets crossing thence to the promenade, making fifty in all, each of 1,200 candle-power. The electric-lighting portion of the scheme would cost 15,300*l.*, and 1,000*l.* had been allowed for contingencies. Mr. Stephenson, the Council's engineer, explained the plans of the electric destructor, which would consume about 15 tons of refuse in 24 hours, the present average being about 30 tons per day. The estimate for the erection of this portion of the works was 8,591*l.*

At a meeting of the Liverpool Corporation lighting committee, held on Friday last, the engineer presented his periodical report. From this it appeared that the equivalent number of the candle-power lamps connected to the supply mains was for private lighting 55,895 and Corporation lighting 6,139, making a total of 62,034, being an increase of 1,584 for the month. The number of units supplied during the month of October to private consumers was 175,054, and to the Corporation 46,247, making a total of 221,301, as against 147,924 in the corresponding period of 1896. Authority was given for the extension of the mains in Whitechapel, Scotland Road, Everton Road, Aighburth Road and Brownlow Hill.

THE HULL DOCKS SCHEME.

THE proposals of the North-Eastern Railway Company in regard to the increase of dock facilities at Hull were the subject of several speeches delivered at the annual meeting of the Hull Chamber of Commerce and Shipping.

The President, in moving the adoption of the report, referred to the North-Eastern Railway Company's proposals. He said that Mr. Gibb and Sir John Wolfe Barry had invited them to inspect plans of their proposals with regard to the docks, and he would only remark that he was pleased to see that the plans provided for the accommodation of the railway and river craft. He hoped it would be such as met the views and requirements of those trades. As to the Hull and Barnsley Bill, he said if it would make that company more useful, it would have the support of that Chamber.

Mr. Arthur Wilson, in seconding the motion, also referred to the North-Eastern Railway Bill. He said the plans were practically the same as those of last year, with some considerable improvements, which he hoped might take away any feeling of opposition against them which had previously existed. The North-Eastern Railway Company had not been

satisfied with only going in for what they proposed to do last year, but were going in for a larger scheme, which, he was pleased to say, if carried out, would most materially benefit the timber trade. He hoped the representatives of that trade had seen the plans and agreed with their practicability, seeing that they would provide the facilities which were so urgently required for the carrying on of their large and particularly flourishing trade. There was one portion of the scheme which would come before the Hull Corporation. The North-Eastern Company had asked for what was called the Western Reservation, and the Hull and Barnsley had also asked for it. There came the difficulty of two people wanting the same thing. It was most important so far as the port was concerned, and its utilisation would facilitate the trade. There was not a doubt about the fact that it would not do the Hull and Barnsley Company the slightest harm if the North-Eastern Company got it. The Hull and Barnsley Company had any amount of land to the east of the Alexandra Dock, and they could go on extending their docks in that direction indefinitely, if they could find the money to enable them to do so. There was a legal question which it was unnecessary for him to refer to, and would be thrashed out in the House of Commons committee. He hoped that House would support them, for the extension of the timber trade was absolutely necessary. He was in this connection referring to the clause which was put into the Bill when the North-Eastern Company took over the docks. The trade of the port absolutely demanded that these facilities should be provided for, and he hoped that when the Bill came before Parliament that that great improvement would be carried. They could not expect to get such schemes as a tunnel under the Humber, which was one of the wild ideas that got into people's heads. Such things might come in forty or fifty years, but they would not, in his opinion, come in his day. If they got the present scheme carried it would be of immense benefit to the port. If the North-Eastern Company were allowed to carry out their plans, he had no hesitation in saying they would spend very nearly two millions of money in the various improvements for the benefit of the port, and what the Company most certainly expected was their cordial assistance in the carrying out of those schemes. He felt sure that the oil trade, the timber trade and the grain trade would do their best to carry the scheme through Parliament. He had given them not only his views, but those of his co-directors. In conclusion, he assured the meeting that the resolution to go on with the Bill, when it came before the Board, was agreed to unanimously;

there was not one dissentient. It was not true, as had been stated, that it was carried by only a small majority.

Mr. H. J. Farmer-Atkinson said he was glad to help the North-Eastern Railway Company to spend money, but he was not glad to help them to prevent the Hull and Barnsley spending money. They wanted every company to come to Hull to prosper, but not at the expense of Hull. At present they should hold their hands, only doing the best they could for the city, and taking care that the Hull and Barnsley was not swallowed up. The North-Eastern Railway Company was too big, but not too big if they used their power for the city. Mr. Farmer-Atkinson then advocated the formation of a dock trust, to take the control of all the docks in the port out of the hands of the two railway companies.

Mr. F. R. Pease said that both Mr. Wilson and himself had had great pleasure in going down to the Victoria Timber Dock some time ago as a deputation. They saw the great congestion there; in fact, there was an enormous congestion of timber in that portion of the dock. The result of that visit had been seen in the promotion of the Bill in Parliament to extend the dock accommodation of Hull. The North-Eastern Company were, indeed, desirous of getting on with the help they desired to extend to the port of Hull. It would be useless for him to go into the policy of the short traders and the docks. They had already provided in the Bill for the lighters and keels having a separate entrance. He could not help remembering that last year, in the House of Commons committee-room, a great deal was said of the long stretches of open water which it was said would result from alterations in the docks, but when the promoters said that this time the Corporation pier would be extended down the river, and that the Corporation tidal dock would have a separate entrance, he thought again the North-Eastern Company might be said to be doing their best for Hull. He hoped that, knowing the intention of the company to spend such an enormous sum of money in the improvements, they would have the earnest support of the Chamber in the promotion of the Bill in Parliament.

Mr. Frank Lambert (president of the Seed, Oil and Cake Association), speaking in support of the motion, said he thought the North-Eastern Railway Company had met every possible objection, and had remedied the defects of last year. They desired that the Bill should be passed, as it would be a great advantage to their commercial business.

The motion was then agreed to, and formal votes of thanks and the election of the Council closed the proceedings.

THE GREAT FIRE.

If the roofs of some of the houses burnt down in the City had been covered with copper instead of zinc (which blazes), or lead (which melts), the fire would have been arrested at these buildings, as the flames could not have escaped through the roof.

Full particulars for covering Roofs with Copper in the best manner will be forwarded on application to

**EWART & SON, 346 - 350 EUSTON ROAD,
LONDON, N.W.**

SAFETY WINDOWS AND FITTINGS.

WINDOWS bring a great many fees to the Patent Office every year. They are always before the eyes of inventors, and it is difficult to look at any ordinary window without the conviction that several improvements are feasible. A glance over the index of a year's specifications of patents suggests how numerous are the efforts to realise ideas about lifts, weights, stays, pulleys, fastenings, guards, dust excluders, opening and closing apparatus, and so forth. The firm of Messrs. Tonks, Limited, is associated with window improvements as well as with many

Ordinary sash window with Nicol's fittings, showing batten rod hinged back to allow sashes to be brought into room.

Continuous hinge for use with casements.

Casement fitted complete.

Sectional elevation, showing scroll weather check at top and bottom.

other classes of aids to comfort and adornment in buildings, but their new series called "Nicol's Patent Safety Windows and Fittings" can be considered as accomplishing a revolution in the construction of windows. In a few words the invention may be described as the application of metal-work to windows in a manner which combines efficiency and strength without any heaviness. It is well to premise that in no degree need the character desired for a window by an architect be diminished by the improvements, which are applicable to cottage windows no less than to those in the largest mansions, schools, hospitals, and other public buildings. By means of the invention the difficulty and danger of cleaning windows need no longer trouble servants. Sashes can with little difficulty be turned as readily as any folding

screen, and washed within a room. All other operations are no less easy. This arises from what may be called the working parts of the woodwork being faced with metal sections, which allow of motion that would be impossible in any other way. The sections of beads, draught and dust protectors, weather-guards, &c., are made in lengths with counter-sunk screw holes 3 inches apart, and can be obtained in zinc or brass, bronzed or gilded.

Messrs. Tonks have arranged all the parts to work together for varieties of their patent slide hinge window and sash hinge window, and it is desirable that all parts should be obtained as contemplated by the inventor, but the separate fittings can be obtained; repairs are therefore easy. It must not be supposed that the improvements are only to be purchased at a price which is restrictive. The prices, as announced to the trade, are surprising by their moderation, especially when the character of the firm's metal-work is considered. This will be seen from the illustrated description of the improvements which we recommend all our readers to obtain. It may be anticipated

Stone and Wood Work. 37 King Street, Derby.

that the sections will soon be as familiar as small size angles and tees.

The "combined casement and sliding window" is intended for hotels, schools, hospitals and public institutions, and for brick houses when narrow frames are desired. This can become a very handsome window, and produces a pleasing effect when the casement is open with top sash closed. The bottom casement can also be made in two leaves. By the adoption of the patent draught-protector, continuous hinge and scroll weather check, the principal obstacle to the general use of casements is removed. No form of window is more English or more admired, and some people have cheerfully suffered inconvenience rather than give up the casement; but, thanks to Messrs. Tonks, it can now be as impermeable as any other class of window. As the new casement fittings have been adopted throughout the Ruchill Hospital, Glasgow (to mention one building), their efficiency is undoubted. A simple set of fittings for cabin windows is also devised, and has been adopted by railway companies. There are various other novelties in fittings described in the catalogue, and examples of the complete windows are to be seen at the offices of the company in Birmingham, London and Glasgow.

THE LONDON COUNTY COUNCIL AND CONTRACTORS.

IN accordance with one of the recommendations of the special committee on the Works Department adopted by the London County Council, the general purposes committee of the Council have been considering what alterations should be made in the conditions which are imposed upon persons contracting for the Council's work. The committee have now concluded their labours and will shortly present to the Council a report upon the matter, in which they make a series of recommendations involving some important changes in the terms of contract. In their evidence before the special committee several contractors strongly objected to the words inserted in contracts compelling them to observe "the rates of wages and hours of labour recognised and in practice obtained by the various trade unions." The committee now recommend the Council to make the clause read "recognised by associations of employers and in practice obtained by the trade unions." Some objection was taken to the radius within which the regulation as to wages and

hours of labour operated. Under the old form of contract the radius is twenty miles, measured in a straight line from Charing Cross. The Institute of Builders have written suggesting that the radius should be altered to twelve miles, as that is the radius within which the agreement as to wages and hours of labour between the Central Association of Master Builders of London and the various unions operates. The committee have adopted the suggestion and recommend the Council to alter the radius to twelve miles. Objection was also taken to the provisions giving the clerk of the Council power to direct examination of the books of anyone contracting for the Council. The committee now recommend that the power of examination should be limited to the time and wages books and sheets of the contractor. At the same time they suggest that the money penalty clause for breach of this stipulation should be deleted. The committee further recommend that no alteration should be made in the clause relating to the employment of improvers and men with physical infirmities below the full rate of wages, but they express the opinion that in the event of a contractor employing a few of such men, and showing reasonable grounds for so doing, the Council would not press for penalties. No alteration is suggested in the clause with reference to the opening of priced bills of quantities, but the clause providing a penalty for the breach of the stipulation as to displaying at the works the schedule list of wages the committee suggest should be deleted. They also submit for the Council's approval a new arbitration clause. The committee express themselves as strongly of opinion that no outside arbitration should take place except after the completion of the works, and have drawn up a clause to carry out that opinion. Several other minor amendments, chiefly to give effect to the above recommendations, are also suggested.

THE LIFE-WORK OF THE LATE SIR HENRY DOULTON.

IN the "Journal of the Society of Arts" Sir George Birdwood has given the following eulogium on the late Sir Henry Doulton:—

May I be permitted to add to the obituary notice of the late Sir Henry Doulton in this week's "Journal" some supplementary remarks on the great and, in every sense, beneficent impulse given by his personal enthusiasm and public spirit to

he production of cheap art pottery in this country, by the revival in Lambeth since 1871 of the manufacture of ornamental salt-glazed stoneware, of the kind which has become popularly known as "Doulton ware," and since 1873 of under-glaze-painted earthenware, or, as it is now distinctively called, "Lambeth Faience."

The origin of the potteries at Lambeth can be traced back to the seventeenth century, when some Dutch immigrants settled in the parish and made it, what it has ever since remained, the *vicus ceramicus* or "potters' quarter," *par excellence*, of London. They carried on their art there after the manner in which they had carried it on for generations before in Holland, and so firmly rooted it both in Lambeth and Fulham, and also, through their success in these places, among the ancient tilewrights of Staffordshire, that within one hundred years the English manufacture of "Delft," or enamelled earthenware, had almost entirely extinguished that of Holland itself. Thus Macpherson, in his inexhaustible "Annals of Commerce," writes in 1765:—"Formerly we all took our meat off plates made at Delft, in Holland; now the Dutch generally use our Staffordshire ware."

Lambeth was indeed made altogether Dutch, and almost an architectural reproduction of the town of Delft itself, as will be acknowledged by all who can remember that picturesque line of quaint old buildings which once stretched along the Thames between the Archbishop's Palace and Vauxhall Bridge, before it was swept away to make room for the Albert Embankment. The Dutch also introduced into Lambeth the manufacture of salt-glazed stoneware, which had been known in England from the middle of the sixteenth century in the form of old jars and flagons popularly called "greybeards" and "bellarmine." The details of their decoration show them to have remotely been of Eastern origin, and our modern "Doulton ware" is, through the imitation of the early Dutch potters of Lambeth, indirectly derived from them.

Doulton's earliest artistic effort in salt-glazed stoneware was the well-known "Toby jug," which, modified from a Dutch original, had been made at Lambeth from the earliest years of potting there, and was still the typical example of "high art" in Lambeth and Fulham down to 1871. We may laugh at this homely old ale pot now, with its disjointed ornamentation of high-bellied toppers, windmills and hounds and huntsmen in chase of a stag, but it will always be dear to us of the passing generation from its associations with the days of our youth; and after all it is of an appropriate shape and a fine colour, and

it always has a better-proportioned and better-attached handle than is generally seen on our later modern English mugs and jugs, the handles of which are only too frequently undersized, badly modelled and most carelessly applied.

It was not, however, until 1855 when Sir Henry Doulton had completed his apprenticeship under his father, and began to take a leading part in the direction of the firm, that the first real and important advance was made in the artistic character of the work of the Lambeth potteries by the production of terracotta garden vases in both red and buff clay; and a little later attempts were made, on the suggestion of Mr. George Tinworth, to apply incised decoration to small salt-glazed stoneware articles for all kinds of minor uses. Very little progress was, however, made until 1871, when the collection of their work sent by the Messrs. Doulton to the exhibition held in that year at South Kensington took the town, as it were, by storm. Her Majesty the Queen bought half of the tall case of "Doulton ware" shown, and this was the beginning of the actual trade in the Lambeth art pottery.

Even so far the results were only tentative and uncertain. The body of the ware was still coarse, and the only two colours in use were wholly beyond control in the firing. To obtain purity, brilliance and variety of colour on so coarse a ground, and under the trying process of burning was indeed no easy task. But in the end all difficulties were overcome, and at the Vienna Exhibition of 1873 Messrs. Henry Doulton & Co. were able to contribute a series of examples of their artistic stoneware in the final maturity of form and incised sculpture in which we know it now. His success encouraged him to undertake the revival in Lambeth of the old local Dutch art of underglazed painting on "biscuit," which in the course of 150 years had become completely naturalised in England. As in the case of the "Doulton ware," lady artists were chiefly employed in the decoration of the new Lambeth faience, and by 1885, the last occasion on which I thoroughly went into the matter, close on 400 ladies were engaged in this way in the service of the firm.

These particulars will give some idea of the greatness to which "the Lambeth Potteries," under the administration of the late Sir Henry Doulton, have grown, and of their importance as sustaining the character and promoting the commerce of one of the greatest branches of British art industry. But it is not on this account that Sir Henry Doulton's life-work is chiefly deserving of recognition by his contemporaries; nor is it because of the opening he has made for the occupation of

steadily increased numbers of women in a handicraft in which they are so happily fitted by nature to excel, and in a neighbourhood where such employment of female labour had been previously altogether unknown. What we are called upon to honour in him above everything else is, in my humble opinion, his sustained devotion to the principles on which he acted in organising the revival of the old ceramic craft of Lambeth, through the fruitful operation of which it has so rapidly assumed a genuinely indigenous and national—I should like to say folk—type. These simple principles are two—the first inspired by the love which Sir Henry Doulton acquired early in life for the use of the potter's wheel, being to make, so far as possible, every piece intended for decoration on the wheel; and the second, also derived from Sir Henry Doulton's personal experience, to give the utmost scope to the individuality of the designer into whose hands the piece, as thrown from the wheel in its soft state, is at once passed for decoration. The latter principle was altogether unknown, so far as my reading goes, in modern English commercial art until introduced into "the Lambeth Potteries" by Sir Henry Doulton. Previous manufacturers used to retain the services of a special designer, and when he left them the art of their wares departed with him, or was preserved only in weak and degraded mechanical reproductions. But every one of the 400—there are more now, I believe—artists of "the Lambeth Potteries," as I saw them in 1885, was an independent designer of more or less marked originality, strongly racy of the locality and representing every kind and degree of ability, which in one or two instances amounted to the creative power of the true artist. In fact we may say that there are 400 distinct styles in the Lambeth art pottery, although all are founded on the teaching of the Lambeth School of Art, under Mr. John Sparkes, the most perfect draughtsman of strictly conventional floral decoration of our generation. Each artist employed follows the style he or she naturally develops in the practice of the art; and all thus excel according to their capacity, producing that infinite variety of excellence which is the sure criterion of the spontaneous character and vitality of an art. Each artist also signs his or her own work, a most powerful incentive to daily progress in the development of natural gifts. It is in this way that Sir Henry Doulton succeeded in creating a most prolific school, or rather several schools, of English pottery, the influence of which has been felt in the revival of the ceramic arts in all the countries of the Old World, where they had become demoralised during the past fifty years by the prevailing use of machinery in their production.

The influence of Sir Henry Doulton's example in the United Kingdom has been quite marvellous, this country now producing—and it has all been done since 1871—the most artistic commercial pottery of any country in the world.

It is on these considerations that I venture to submit to you, with no more detail than is sufficient to justify it, this statement of the enduring claims of the late Sir Henry Doulton to the gratitude and reverence of his fellow-countrymen.

NEW SCHEMES FOR LONDON.

IN the course of about three weeks above forty Bills affecting the Metropolis will be deposited, says the *Standard*, at the House of Commons. Notice has already been given of these Bills in terms which disclose their general character. Among the projects of this nature coming before Parliament in the ensuing session the tramway projects of the London County Council form a distinguishing feature. These are embodied in two Bills, by one of which the Council seek authority to construct and work a tramway, commencing in Westminster Bridge Road by a junction with the existing line of the London Tramways Company, Limited, proceeding thence westward so as to pass over Westminster Bridge and on to the Victoria Embankment, traversing its entire length, so as to terminate in the precinct of Bridewell. Another tramway, entirely in the parish of Lambeth, is to be constructed by the Council so as to connect the aforesaid line with the system of the South London Tramways Company. The gauge of the proposed tramways will be 4 feet 8½ inches, and it is intended to employ animal power for moving the carriages or trucks. Power is sought whereby the Council will be enabled to enter into certain arrangements with the London Tramways Company, Limited, the London Southern Tramways Company, the South London Tramways Company, and any other company, corporation or persons for the maintenance and working of the whole or any part of the said tramways and for leasing the same by the Council. The Bill is to contain provisions as to the charging of any expenditure under the intended Act with reference to tramways either as a general or a special county purpose, and as to the application of any receipts or revenue arising from or in respect of the proposed tramways.

The other Tramway Bill for which the London County Council intend to make application in the coming session is to

construct tramways in Holborn, Clerkenwell and Islington. One of these lines is to commence by a junction with the North Metropolitan Tramway in Clerkenwell Road, opposite the Holborn Town Hall, passing thence along Rosebery Avenue into and along St. John Street Road and High Street, Islington, terminating by a junction with the existing tramway opposite the north-east corner of the Angel Inn. Three junction tramways are to be formed in connection with this and existing tramways. There is also to be a second tramway, commencing by a junction with the existing North Metropolitan Tramway at its termination in Theobald's Road, and passing in a westerly direction, taking the south side of Bloomsbury Square, and terminating in Bury Street, near the west end of Silver Street. A third tramway is to commence by a junction with the existing North Metropolitan Line in High Street, Shoreditch, at or near the western end of Bethnal Green Road, and terminating in Cambridge Road by a junction with the existing tramway near the east end of the Bethnal Green Road. Power is to be sought for making agreements with companies and persons similar to those specified in respect to the Westminster Bridge and Victoria Embankment Tramways.

The London United Tramways Company intend to apply for leave to introduce a Bill by which they will be empowered to construct and work as many as eight tramways in the counties of London, Middlesex and Surrey. Some of these proposed lines, together with sundry junctions, are designed in connection with tramways already possessed by the company in the Uxbridge Road and the Kew Bridge Road. Either animal power or electrical power is to be employed, the latter to be on the overhead system or otherwise. Electrical depôts are proposed at Shepherd's Bush, Chiswick, Richmond and Acton. The Bill is to empower the Company on the one hand, and the Central London Railway Company on the other, or any other Company or authority, to enter into agreements for the supply of electrical energy.

Application is to be made to the Board of Trade for a provisional order to authorise the Woolwich and South-East London Tramways Company to construct certain tramways in Plumstead and Woolwich. Powers are sought to work the company's existing and new tramways by animal, electrical and other mechanical power.

Electric lighting is an essentially modern institution, and it is evidently destined to make further progress in the Metropolis, seven projects of this nature being now proposed. The Central Electric Supply Company (Limited) seek leave to bring in a

Bill for the exercise of power and the establishment of works in Marylebone, including a generating station or stations, the company to be authorised to supply electrical energy to any other company, body, or person authorised to supply electricity for any public or private purpose "within the county of London or the vicinity thereof." The Metropolitan Electric Supply Company (Limited) propose to bring in a Bill for establishing a generating station on lands in Willesden and Acton, cables and conduits being laid to the company's station at Amberley Road, in the parish of Paddington, which parish, it is stated, forms the area which the company are authorised to supply with electricity under a Lighting Order which the company obtained in 1895. The Chelsea Electricity Supply Company (Limited) give notice of a Bill by which they are to be empowered to purchase land in the parish of St. Luke, Chelsea, compulsorily, and to erect generating stations thereon. In four instances the notice has reference to an application to be made to the Board of Trade for a Provisional Order. The local authorities proceeding in this manner are the Vestry of Bermondsey, the Vestry of St. Marylebone and the Urban District Council of Barnes. An application by the Great Western Electric Light and Power Company has reference to the parish of Lewisham.

The railway Bills which are likely more or less to affect London, though in some cases in a very minor degree, are twenty-two in number. One of the most interesting is the Bill which the Metropolitan Railway Company propose to introduce. This is remarkable for the extent to which it provides for the ventilation of the line, and the introduction of electricity as the motive power. It is proposed to acquire certain lands, a term which includes houses and buildings, in order to make on such sites openings for the ventilation of the railway, the localities specified being situated in Paddington, the Marylebone Road, the vicinity of Upper Baker Street, Cleveland Street, the Finchley Road and numerous premises in the Euston Road. The company seek to be empowered to work by means of electricity the traffic on their existing railways, and to enter into agreements for working in like manner the traffic on the joint lines of the Company and the District Railway. It is contemplated to appropriate certain lands for the purpose of erecting stations for generating electrical energy, at a spot adjoining the company's Edgware Road Station.

Leave is to be asked to introduce a Bill incorporating a company which is to be empowered to construct a railway commencing in and under the High Street, in the borough of Southwark, and terminating in and under the road known as

READING CASES FOR THE ARCHITECT.
Price 2s.—Office: 175 Strand, London, W.C.

Brixton Hill. A subway, for passengers only, is to commence in and under the Kennington Park Road, forming a connection with the Oval Station of the existing City and South London Railway Company, and terminating under Brixton Road. The motive power to be employed on the proposed railway is to be electricity, cable, or other mechanical power except steam locomotives. The Bill is to authorise working and other arrangements with the City and South London Railway Company, who are also to be empowered to guarantee and subscribe capital. The City and South London Company are going to apply for a Bill giving an extension of time for the acquisition of lands, and empowering the Company to sell or lease a portion of their undertaking to the City and Brixton Company, or to any company to be authorised during the ensuing session to make a railway from the company's line to Brixton Hill.

Application is to be made for an Act to incorporate a company to construct an underground railway from Paddington to Charing Cross, the motive power to be electricity. The Charing Cross, Euston and Hampstead Railway Company are going to apply for a Bill authorising them to abandon a certain portion of their authorised railway, and to construct a new underground line, commencing by a junction with the railway authorised by their Act of 1893, at a point under the Charing Cross Road near the Garrick Theatre, and terminating at a point under or adjoining No. 23 Craven Street. Agreements are to be authorised with the South-Eastern Railway Company so as to provide means of communication between the stations at Charing Cross.

Notice is given of a Bill to incorporate a company for the purpose of constructing an underground railway extending from New Cross Road, under the Old Kent Road, New Kent Road and the Waterloo Road. Electric or cable power is to be employed, and working and other agreements are sought with the London and South-Western, the Baker Street and Waterloo, and the Waterloo and City Railway Companies.

The Bill to be introduced by the London, Tilbury and Southend Railway Company proposes the alteration of sundry bridges, roads and footpaths in West Ham, East Ham and Barking. Power is sought for the subscription of capital to the Whitechapel and Bow Railway. Also to require the Great Eastern Railway Company, or the London and Blackwall Railway Company, to give the Company additional facilities for the use of the Fenchurch Street Station, on the London and Blackwall Railway, and to provide that, in default of agreement

between the Companies concerned, the matters at issue shall be determined by arbitration. The Bill is further to subject the Great Eastern Railway Company, in default of their providing the facilities required, to penalties, or to make other provisions for enforcing and securing the same. The Whitechapel and Bow Railway Company give notice of an application to introduce a Bill giving power to the Metropolitan District Railway Company and the London, Tilbury and Southend Railway Company to subscribe capital and guarantee interest in respect to this undertaking.

The Great Northern and City Railway Company seek leave to introduce a Bill for the extension of their authorised railway to Finsbury Park, whereby it will terminate at or near the Finsbury Park station of the Great Northern Railway. A railway is to be constructed in the parish of St. Mary, Islington, being a diversion of the existing Canonbury branch of the Great Northern Railway, and commencing by a junction with that branch near the northern end of the tunnel, and carrying the line under Highbury Fields, terminating by a junction with the branch railway.

Notice is given concerning two Bills under the title of the London, Walthamstow and Epping Forest Railway. One is for the abandonment of the railways and works authorised by Acts obtained in 1894 and 1895, and to provide for the winding-up and dissolution of the company. The other Bill is to revive and extend the period limited by the previous Acts for the taking of lands and completion of works. Further powers are sought in relation to capital and in respect to agreements with other companies.

The London and North-Western Railway Company give notice of application for a Bill which, so far as London is concerned, provides for the acquisition of certain lands in St. Pancras, and in the district of the Poplar Board of Works. The Midland and the North London Railway Companies are to be empowered, respectively, to apply to all or any of the purposes of the intended Act in which they are interested any capital or funds belonging to them.

The South-Eastern Railway Company give notice of an application to Parliament for power to construct several subsidiary railways, which, if carried out, may be expected to preclude many of the complaints now made as to the working of the company's suburban and other traffic. A railway is proposed to commence by a junction with the company's line in the parish of St. Paul, Deptford, and uniting with the Ladywell loop, in the parish of Lewisham. Another line, wholly

in Lewisham, is to connect with the Dartford loop, near Manor Lane. A junction line and another railway are proposed in the same district. A railway commencing in the parish of Lee proceeds to Orpington. The Various Powers Bill of the London, Brighton and South Coast Railway Company includes the formation of a short railway in the parish of St. Paul, Deptford, and the widening of the company's railway from Victoria to Clapham Junction. The London and South-Western Railway Bill will include the widening and improvement of the main line in Lambeth.

The Great Central Railway Company intend promoting a Bill giving them power to purchase, by compulsion or agreement, lands, houses and buildings in Marylebone, three different sites being specified, such being required for purposes connected with the company's undertaking. The General Powers Bill of the Great Eastern Railway Company will be designed to cover a large number of operations, but the only apparent matter connected with the Metropolis consists in a proposal to convert a swing bridge at Bow Creek into a fixed bridge.

The Great Northern Railway Company seek power to construct two railways at Finsbury Park, in the parishes of St. Mary, Islington, and St. Mary, Hornsey. The General Powers Bill of the Great Western Company can hardly be said to affect the metropolitan area, although the administrative County of London is mentioned in the notice.

The Muswell Hill and Palace Railway Company propose the construction of certain railways, two of which are to be connected with the Enfield branch of the Great Northern Railway and a third with the Great Eastern. The Bill is also to authorise agreements with these companies. A Bill is to be introduced for a revival of powers in respect to the Latimer Road and Acton Railway, and to extend the time limited by the company's Act of 1895 for the completion of the works authorised by their Act of 1882.

The Midland Railway Company seek to introduce a Bill, concerning which they make a separate announcement to show how little it has to do with London, the only power to be exercised in the administrative county being that of stopping up and discontinuing as a public thoroughfare part of a public footpath known as Swallow's Gardens, intersecting and abutting upon lands belonging to the company fronting Royal Mint Street, Whitechapel.

In addition to their two tramway schemes, the London County Council give notice of three other Bills. One is for the amendment of the London Building Act, another is a General

Powers Bill, and the third has reference to the sewage of Acton. The General Powers Bill provides for several street improvements, among which are the widening of the York Road and the street called Albert Embankment, the reconstruction of the Rosemary Branch Bridge over the Regent's Canal, the removal of several gates, bars, posts and railings in Camberwell, in Duncan Terrace, Islington, in Nelson Square, Blackfriars Road, and in Long Street, Shoreditch. It is also proposed to remove a wall now blocking the northern end of Caesar Street, in Shoreditch.

The Corporation of London give notice of a Bill to provide for the extension and enlargement of the Foreign Cattle Market at Deptford, together with the construction of railways, a tramway, and other works in the parishes of St. Paul and St. Nicholas, Deptford. It is primarily intended that the tramway shall be worked by animal power, but provision is to be made in the Bill for substituting electricity, gas or cable power, as may be agreed upon between the Corporation and the local and road authorities; or, failing agreement, as may be determined by the Board of Trade.

Among the miscellaneous schemes to be brought before Parliament is one for the incorporation of a company to carry out an extension of the Victoria Embankment by a river wall and roadway along the foreshore of the Thames, commencing at or near the south-eastern corner of the Victoria Tower Gardens, adjoining the Houses of Parliament and terminating at the western end of Lambeth Bridge. Four new streets are proposed in the neighbourhood of the Horseferry Road, as also a widening of that thoroughfare, together with Marsham Street and Church Street. The Bill is likewise to confer authority on the Company to enter into agreements with the local Vestry and the London County Council, and to transfer certain powers to the latter body.

A Bill is proposed to empower the Trustees of the London Parochial Charities to sell, and the Postmaster-General to purchase by agreement, certain lands situated on the south side of Little Britain, adjoining the public gardens known as the Postmen's Park, the said lands to be an open space for the use and benefit of the public.

The Southwark and Vauxhall Water Company seek further powers to enable them to fulfil their statutory obligations in relation to the supply of water. They propose to construct two new storage reservoirs, one in the parish of Walton-upon-Thames, the other to be partly in that parish and partly in West Molesey. Further power is sought as to the quantity of

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact **it will Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish. Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION.

water which the Company may take from the Thames in any day of twenty-four hours. The Staines reservoirs joint committee will apply for power to enlarge two reservoirs authorised by the Act of 1896. The Gaslight and Coke Company intend applying to Parliament for authority to consolidate their capital, which now consists of several classes, giving rise to much complexity. No power is sought to raise additional capital.

CAN BUILDINGS BE MADE FIREPROOF?

(Concluded from last week.)

UNBROKEN flat ceilings should always be preferred to panel work with its beams projecting below, no matter in what way they may be protected. This fire greatly emphasises this fact. The exposed area is increased when floors are built as they were in the Horne buildings, and, besides, the panel forms a pocket which confines the heat and makes it more effective. An even surface deflects heat as it does light, and if the surface is even, the covering of the beams where protection is most needed will not suffer the worst punishment as it did in the Horne buildings. The fact that the beams which were uncovered by the action of the fire were not deflected and ruined is no reason why they should not be covered so that the tile will not come off in any kind of fire.

The bottom of the arch should also be low enough under the beam to permit the bottom flange to be covered with a hollow tile, or, at least, with a solid tile having an open space between the covering and the beam. As the material is now manufactured, this is rarely accomplished, and the workmanship in putting the beam covers in place is often bad. It seems as if there might be an improvement in this direction, and that the material should be designed in such a way that it will not only be theoretically good, but so designed that the beam cover cannot possibly be improperly placed.

All partitions and all column covering should be built on the arches. Cinder concrete which will crumble away is not much better for support than wood which burns away. Builders may object to such a provision, but it would not be a great hardship or add materially to the cost.

Wood should not be used in partitions in any way whatever. Iron should be used to frame all openings.

In conclusion, a recapitulation of the most important points intended to be brought out by this paper may not be out of

place. The best design, the best specifications and the best workmanship in every detail of the construction of a building are quite essential to making it a fireproof structure which can be depended upon in any emergency. The whole exterior of a building should be built of materials that will not be injured by heat. This fire would point to brickwork as the most desirable material, and without question threw terra-cotta under a cloud. This observation should cover the windows as well as the walls, and points to something new and better than has yet been used to any great extent in building operations. Large store buildings, open over entire floors and through all storeys, must always be a dangerous fire risk, and if it is important that large apartment stores should occupy such quarters during business hours, the only way to give them any satisfactory security against fire must be in subdivision of departments with fireproof curtains or some other movable divisions that can be quickly and easily operated. As now manufactured, porous tiles or terra-cotta fireproofing can be relied upon to protect the steel construction, while the hard-burned material cannot be depended upon with the same certainty. Woodwork covered with wire lath and plastering is not fireproof construction, and the efficiency of concrete in floors was not tested by this fire.

The discussion was opened by the reading of a written communication from Messrs. Gustave Kaufmann and Emil Swensson, who with Mr. F. L. Garlinghouse formed the board of experts who reported upon the effects of the fire to the insurance companies. These gentlemen strongly attacked some of the statements made by Mr. Purdy, asking how the author knew that the so-called cinder concrete laid above the floor arches had failed under the action of the heat, the experts evidently believing that the loose material found there by Mr. Purdy, and called by him cinder concrete was not concrete at all, but cinders with little or no cement in it. They also seemed to think that the Book Concern building was subjected to greater heat than it was credited with by Mr. Purdy, who based his opinion somewhat upon the condition of the exterior of the building. The Book Concern building, the experts said, was constructed of a stone that will stand the action of heat far better than the Horne building, for the front of which Indiana limestone was used, and it was therefore not fair to draw an inference upon that evidence. They again repeated their preference for concrete as a fireproofing material, basing their views upon the recent tests of concrete floor by the New York City Building Department, which have lately been described in these columns.

CHEADLE & CO., THORNLEY ST. WORKS, WOLVERHAMPTON.

Manufacturers of all kinds of Butchers' Hooks and Fittings, Shelf Brackets, Improved Spout Irons and Wall Ties (see drawings), Shutter Flaps, Staples, Holdfasts, Vine Fittings and Wire Stretchers of every description, &c. Black, Japanned, Galvanised and Tinned Ironwork to pattern or order.

Illustrated PRICE LIST on application

SOHO COWL & VENTILATOR

(NICKLIN & MILWARD'S PATENT.)

This COWL has been used as a Ventilator, both on Workshops and Offices, with most satisfactory results, and has proved a conspicuous success as a House Cowl, possessing as it does great suctional power, perfectly noiseless action, and great durability, being made of steel.

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."

"Forward the 10-inch cowl on order at once; we have fixed the others, and find they give every satisfaction."

"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

REPRODUCTIONS OF

The FINEST EXAMPLES.

Mr. Howard Constable, the next speaker, could not agree with Mr. Purdy that the temperature of the Pittsburg fire had no bearing upon the author's conclusions. He stated that in a room only 16 feet square he had found that there existed a difference in temperature in two localities of 1,000 degrees. He believed the word "fireproof" as applied to building material to be a misnomer, as the fire-resisting and water-resisting properties of a substance should both be considered, and pointed out that the shape of a material had everything to do with its value from these standpoints. He had made a number of experiments upon a material intended to withstand the action of fire and water and showed a number of specimens that had been subjected to test. The highest grades of Portland cement had in a number of instances not stood as well as cement of poorer quality. He also stated in response to a question that in one instance, where a 20-inch beam protected with 3 inches of concrete was subjected to an intense heat from below, the temperature of the upper flange of the beam after several hours only rose to 200 degrees.

Mr. John R. Freeman discussed Mr. Purdy's paper at considerable length, at first calling attention to the need in investigating fires of noting what metals had been melted as a means of estimating the temperature. He spoke very strongly in favour of automatic sprinklers, and said that if the Book Concern building had been protected by sprinklers the loss would have been inappreciable. In speaking of the relative value of different forms of construction as a means of preventing fire, that in the New England mills, which were almost invariably constructed with wooden columns, beams and floors, but which were provided with automatic sprinklers, that loss from fire did not exceed that of the mills in England, where iron columns and beams with brick arches was the usual form of construction. He referred to the shops of Brown & Sharpe, in Providence, which were built upon lines similar to the English mill practice at a cost of from 2 dols. to 3 dols. per yard, and he said that he did not consider them any more fireproof than if they had used the ordinary mill construction at a cost of 70 cents per yard, if equipped with sprinklers at an additional cost of from 2 to 3 cents per square yard. He believed that sprinklers should be used in all buildings tall enough so as to be beyond the reach of fire apparatus. He then referred to the relative values of cast-iron and steel as a material for building, and it had been his experience that cast-iron up to a certain temperature will carry its load well and will not crack as popularly supposed when subjected to heat

and then to cold water. He gave evidence to show the value of tin-clad shutters, and advocated the use of double fire doors in partition walls. Tin-clad wooden shutters permitted the transmission of heat more than iron shutters, and the nails used in making them should be long, for the reason that the outer end of the nail becomes hot by conduction and chars the wood.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

26575. George William Hitchen, for "An improved chimney-pot."

26626. Laura Sheppard, for "Safety smoke conductor for drain testers."

26645. John Price, for "Improvements in or relating to pipe joints."

26655. William Phillips Thompson, for "Improvements in fluted or ridged roofing and like tiles, and in their arrangement when covering in."

26905. Frederick Thomas Grant, for "Improvements in air inlets for drains."

26991. Joshua Binns, for "Improvements in or connected with hoists or lifts."

27018. Charl Oietrich, for "Improvements in and relating to hanging-brackets for line shafting."

27162. Sir Andrew Noble, K.C.B., and George Stuart, for "Improvements in lathes."

27260. Joshua George Mills and Peter Campbell, for "Improvements in apparatus or appliances to be used in place of rope for lashing scaffolding poles, ledgers or the like."

1220. Peel chimney-cowls or pots.

To INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from $\frac{1}{4}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{1}{8}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xv.

COMPETITIONS OPEN.

BELPER.—Jan. 8, 1898.—The Belper Rural District Council offer premiums of 15 guineas and five guineas for the two best sets of plans and reports for Crich water supply. Mr. Joseph Pym, clerk, Belper.

BELPER.—May 1, 1898.—The Belper Urban District Council offer premiums of 50 guineas and 25 guineas for the two best schemes of sewage disposal. Mr. Joseph Pym, Urban District Council Offices, Belper.

BOOTLE.—Dec. 31.—The Corporation invite competitive designs of a central fire station, firemen's dwellings and district police station. Mr. J. A. Crowther, borough engineer, Bootle.

DORKING.—Dec. 15.—Competitive designs and plan, with descriptive report thereon and approximate estimates, are invited for erection of infirmary upon workhouse grounds. Mr. George Scales, 35 High Street, Dorking.

PORT ELIZABETH.—Feb. 15, 1898.—The public library committee offer prizes of 100 guineas and 50 guineas for designs for a new library building. Messrs. Wm. Savage & Sons, 85 London Wall, London, E.C.

CONTRACTS OPEN.

ALNWICK.—Dec. 16.—For erection of two houses at Glanton. Mr. George Reavell, jun., architect, Alnwick.

BARKING.—Dec. 21.—For erection of an electric-light station at the rear of the public offices, East Street. Mr. C. J. Dawson, Public Offices, Barking.

BARROW-IN-FURNESS.—Dec. 15.—For erection of electric-lighting station, Buccleuch Street. Borough engineer, Town Hall, Barrow-in-Furness.

BIDEFORD.—Dec. 28.—For alterations and repairs on the post office premises. Mr. R. T. Hookway, architect, Bideford.

BIRSTALL.—Dec. 15.—For addition to shop, Market Place. Mr. John H. Brierley, architect, Hanover Street, Batley.

BRADFORD.—Dec. 17.—For erection of herring-curing establishment, stabling and other works in Buck Street. Messrs. Hodgson & Farrar, architects, Old Bank Chambers, Bradford.

BRIDLINGTON.—Dec. 18.—For completion of a grammar school and master's house. Messrs. Botterill, Son & Bilson, architects, 23 Parliament Street, Hull.

BRIDLINGTON QUAY.—Dec. 16.—For erection of four houses and premises, East Side, Flamborough Road. Mr. J. Earnshaw, architect, Wellington Road, Bridlington Quay.

BRITON FERRY.—Dec. 20.—For erecting a villa residence. Mr. H. Alex. Clarke, architect, Briton Ferry.

BURNLEY.—Dec. 29.—For extension to the electric-lighting station. Mr. G. H. Pickles, borough surveyor, Town Hall, Burnley.

BROMLEY.—Dec. 16.—For erection of four pairs of cottages. Mr. E. Bragg, East Street, Bromley, Kent.

CANTERBURY.—Dec. 14.—For erection of a schoolroom at Upstreet. Mr. F. Heath, Westbere Court.

CARDIFF.—Dec. 14.—For erection of public urinal, &c., in Clare Road and public latrines and urinal in Fitzroy Street. Mr. W. Harpur, borough engineer, Town Hall.

CHESTER-LE-STREET.—Dec. 13.—For erection of a shop and wareroom in the market. Mr. R. G. Cowe, architect, Chester-le-Street.

CHORLEY.—Dec. 16.—For erection of a free library. Messrs. Jolly & Buckley, architects, High Street, Chorley.

COLCHESTER.—Dec. 14.—For erection of stables, coach-house, hay-loft, &c., at The Limes, Crouch Street. Mr. Herbert Goodyear, borough engineer and surveyor, Colchester.

COLLINGHAM BRIDGE.—Dec. 15.—For erection of an organ-chamber and vestry to church. Mr. C. Hodgson Fowler, architect, The College, Durham.

CORK.—Dec. 14.—For erection of stores and residential quarters at Patrick's Quay. Mr. James F. McMullen, architect, 30 South Mall, Cork.

CORNWALL.—Dec. 15.—For erection of clubhouse. Mr. Sampson Hill, architect, Green Lane, Redruth.

CORNWALL.—Dec. 15.—For erection of a piggery and other work at Eglosmerther Farm. Mr. George Gow, Tregothnan Office, Truro.

CRICKHOWELL.—Dec. 13.—For alterations and additions to the National Schools, Llangynidr, near Crickhowell, Breconshire. Mr. F. Baldwin, architect, 8 Lion Street, Brecon.

DEVIZES.—Dec. 14.—For additions to the Wilts County Pauper Lunatic Asylum. Mr. Charles S. Adye, county surveyor, County Offices, Trowbridge.

DEVON.—Dec. 14.—For erection of cottages at Loddiswell and Gara Bridge Stations, on the Kingsbridge Branch, Devonshire, for the Great Western Railway Company. Mr. G. K. Mills, secretary, Paddington Station, London.

ARCHITECTS PLEASE NOTE.

PATENT.

The "Waterwitch" Cistern is now fixed and in operation at the

HOTEL COBURG, LONDON.

A leading Architect says of this Cistern, "I was struck with its simple and noiseless action."

CHEAP BUT EFFICIENT IN ACTION.

THE VALVELESS SYPHON CO., KIRKSTALL, LEEDS.

DEWSBURY.—Dec. 13.—For construction of an iron shed at the gasworks. Mr. H. Dearden, borough surveyor, Town Hall, Dewsbury.

FAIRFIELD.—For erection of a pair of semi-detached houses and two shops with residences. Mr. J. H. Burton, architect, 2 Guide Lane, Hooley Hill.

FRINTON-ON-SEA.—Dec. 31.—For erection of a school to accommodate 150 children. Mr. S. T. James, architect, Frinton-on-Sea.

GRIMSBY.—Dec. 18.—For alterations to 242 Cleethorpe Road. Messrs. Mitchell, Son & Co., surveyors, 112 Cleethorpe Road, Grimsby.

GUILDFORD.—Dec. 13.—For extension of produce shed in the cattle market. Mr. C. G. Mason, borough surveyor, Tuns Gate, Guildford.

GUILDFORD.—Dec. 14.—For additions to the administration block and block B at the isolation hospital at Woodbridge. Mr. Edward L. Lunn, 36 High Street, Guildford.

HAMMERSMITH.—Dec. 13.—For erection of disinfecting-chamber and van buildings at the wharf, Chancellor's Road. Mr. H. Mair, surveyor.

HARTBURN.—Dec. 15.—For erection of a billiard-room and other additions to Landieu. Mr. E. A. Whigham, architect, 59 High Street, Stockton-on-Tees.

IRELAND.—Dec. 14.—For erection of single one-storey cottages at Monaghan Road Station, at Annakera, and at Pound Lane level crossing, near Portadown, for the Great Northern Railway Company (Ireland). Mr. T. Morrison, secretary, Amiens Street Terminus, Dublin.

IRELAND.—Dec. 21.—For erection of a dispensary house in the village of Derrygonnelly, Enniskillen. Mr. Richey Wilson, Board-room, Workhouse, Enniskillen.

ISLINGTON.—For erection of block of flats. Mr. Walter Stair, 9 Queen Victoria Street, E.C.

KEIGHLEY.—For erection of a warehouse at Providence Mills, Oakworth. Messrs. John Judson & Moore, architects, York Chambers, Keighley.

LEEDS.—Dec. 17.—For erection of a block of four houses, and three houses and a shop, in New Road Side, Horsforth. Mr. J. P. Kay, architect, 34 Prudential Buildings, Leeds.

LEEDS.—Dec. 19.—For construction of lavatory and conveniences in the Corn Exchange. City Engineer, Municipal Buildings.

LLANDUDNO.—For completion of the Duke of Clarence Memorial church. Rev. Francis G. Jones, vicar, Iorwerth House, Llandudno.

LOWESTOFT.—Dec. 15.—For erection of a house, &c., Blundeston. Mr. Sidney Rivett, architect, 3 South Quay, Great Yarmouth.

MANCHESTER.—Dec. 28.—For erection of thirty-two two-storey tenement buildings fronting a new street between Corn-wall Street and Spittal Street, and eighteen cottages fronting George Leighton Street. City Surveyor, Town Hall, Manchester.

MANCHESTER.—Dec. 28.—For erection of thirty-six two-storey tenement buildings fronting Chester Street, Marsland Street and Hulme Street, Hulme. City Surveyor, Town Hall, Manchester.

MERTHYR TYDFIL.—Dec. 17.—For erection of a library, dwelling-house, &c., at Cefn Coed. Mr. R. C. Jenkins, surveyor, Cefn Coed.

MORECAMBE.—Dec. 13.—For additions and alterations to Dr. Glegg's house, West View Terrace. Mr. James Marshall, architect, Back Crescent, Morecambe.

MYNYDDISLWYN.—Dec. 20.—For erection of two additional classrooms and other works at the Pontllanfraith school. Mr. George Rosser, architect, Abercarn.

NEWCASTLE-ON-TYNE.—Dec. 13.—For erection of Primitive Methodist Central Church schools and vestries in Northumberland Road. Messrs. Davidson & Bendle, architects, 33 Grainger Street West, Newcastle-on-Tyne.

NOTTINGHAM.—Dec. 13.—For additions to lunatic asylum. Mr. G. T. Hine, architect, 35 Parliament Street, Westminster, S.W.

PONTEFRAC.—For construction of licensed premises, Market Place. Messrs. Tennant & Bagley, architects, surveyors, &c., Pontefract.

ROCHDALE.—For plastering six houses in Berwick Street and fourteen in Stamford Street. Mr. Nathan Mutch, Moss Cottage, Milnrow Road.

SCOTLAND.—Dec. 15.—For erection of shops and dwelling-house at corner of St. Catherine's Road and Bogton Place, Forres. Mr. John Forrest, architect, 129 High Street, Forres.

SKEGNESS.—For erection of the Primitive Methodist new chapel, with 450 seats. Mr. Hy. Harper, architect, Market Place, Nottingham.

BUILDING AND BUILDERS.

THE contract for the building of the new Bluecoat School at Horsham has been signed. Messrs. Langley & Son, of Crawley, are to be the builders, and the cost will be 294,243 $\frac{1}{2}$. The new school is to be finished in three and a half years.

NOTICE has been given to the Hull Corporation to terminate their tenancy of a stone-yard adjoining the Paragon Station at Hull, rented from the North-Eastern Railway Company. The company require the land for the enlargement of Paragon station.

THE plans of the proposed new church in All Souls parish Heywood, have been approved by the Ecclesiastical Commissioners, and it is hoped shortly to begin building operations. In the same parish the new mission church of St. Aidan, at Marland, is to be dedicated on the 15th inst.

MRS. ELAM has decided to erect at her own expense and as a memorial to her late husband new premises for the use of the Unitarian congregation which at present meets in the Iron Church, Manor Road, Liscard. The scheme includes a new church to seat 300, a church hall to seat 250, and a number of classrooms, &c.

ON Saturday a huge crane on an elevated tramway on the premises of Messrs. Lowe & Sons, contractors, Burton-on-Trent, fell to the ground, and carried with it a block of stone weighing several tons. Three men were buried in the debris and seriously injured, one man, named Rowe, being terribly mutilated. A number of masons working in an adjoining shed had a marvellous escape. They heard the snapping of the

heavy beams, and just managed to get out of the shed as the huge cogwheel and portions of the machinery came crashing through the roof.

At Hammersmith Mr. Drew held an inquest touching the death of William Green, 47, a labourer, of 31 Prince's Place, Notting Hill, who died in the West London Hospital. A large number of witnesses were called, who deposed that the deceased was working in a cutting at Woodhouse Park, Shepherd's Bush, on the new Central London Railway, with another man, breaking down a clay bank 7 feet high and 18 inches wide. To make the work easier deceased and his mate undermined it to the extent of 12 inches, when suddenly the clay collapsed and partially buried the deceased. He was taken to the hospital, where he died the same night.

A PUBLIC meeting was held in the Lesser City Hall, Brechin, on the 2nd inst., in connection with the proposed restoration of the cathedral. Provost Scott occupied the chair. The Provost referred to what had already been done, and hoped the movement would get the hearty support of all classes in Brechin. Ex-Provost Lamb moved that the meeting gave its hearty support to the proposed restoration of the ancient cathedral of Brechin, and commended the scheme to the liberality of all interested in the city and church, especially to all natives of Brechin at home and abroad. Although that motion dealt with an ecclesiastical fabric he did not think that was the time for anyone to air their opinions on ecclesiastical subjects. Mr. A. Robertson seconded the resolution. Mr. William Smart supported the resolution, which was carried enthusiastically.

At the weekly meeting of the York Board of Guardians last week Alderman Agar moved the adoption of a report of the workhouse committee in reference to improvements at the workhouse. He explained that the present appliances for washing were very inadequate to the requirements of the house, and it was proposed to build a steam laundry at a cost of 3,775*l*. At a later date dining-hall and kitchen improvements would have to be effected, and for kitchen purposes they would need steam. They would also require hot water for the house, and a great portion of the building could be heated by steam. They proposed therefore to have two boilers large enough to do the whole work. The fittings common to both laundry and kitchen block would cost 850*l*., which brought the total to 4,625*l*. They would probably require a clerk of works, and the whole cost might be put down at something like 5,000*l*. Mr. T. Jacques seconded the motion, which was carried unanimously.

ELECTRIC NOTES.

A SHOCKING accident occurred on Monday at the Brush Electrical Engineering Works, Loughborough. William Bray, fitter, was turning brass rings in a powerful lathe when his head became jammed between the sharp lathe and the large piece of brass from which the rings were being made. The lathe, catching him just below the eyes, literally cut his head into three pieces, and he was picked up dead.

The Craigpark Gutta-Percha Works, Townmill Road, Glasgow, which have for some time been in disuse, have now been taken over by a new company, of which Mr. A. Bruce Maclean is manager. The premises are being fitted up for the manufacture of electric-light cables, an industry new to Scotland, and it is expected that in the course of a week the machinery will be all in working order. The cables used in Glasgow and other Scottish cities for lighting purposes have hitherto been supplied by English firms. The Craigpark Company, as now constituted, will manufacture telegraph and other wires, as well as cables for lighting purposes.

MR. W. C. HAWTAYNE, London, who was appointed consulting engineer to the Police Commission of Perth to report on their proposed scheme for the introduction of electric lighting into the city, has prepared a long statement in regard to the prospects of the undertaking. The report was before a special meeting of the Perth Police Commission, on the 4th inst., and was generally regarded as somewhat too sanguine. Mr. Hawtayne says it is an ascertained fact that, with one or two exceptions, every undertaking of the kind in the kingdom under municipal control that has been at work for more than three years is now yielding a substantial sum towards the reduction of town's rates. Mr. Hawtayne recommends the erection of thirty-seven arc lamps of about 2,000 candle-power, such as can be seen in Princes Street, Edinburgh. For business premises, houses, &c., he estimates that 10,000 lamps of eight candle-power will be taken up within a comparatively short time. He recommends the adoption of the low tension current system, and estimates the cost at 25,250*l*. If a destructor of refuse is introduced, the cost will be increased to 27,950*l*. The gross revenue he estimates at 4,800*l*. The working cost of the scheme is put down at 2,158*l*., and under the profit and loss statement he brings out that there will be profit available for reduction of rates or other purposes amounting to 1,251*l*.

VARIETIES.

THE merits of "Petrifite" as a sort of universal cement were lately made known in a paper read before the Architectural Association. We have already drawn attention to its qualities, by which it can become a most useful aid in building and engineering construction. A limited company has been formed to purchase the patent rights, quarries, plant, &c., as also to carry on and grant licenses for the manufacture and sale of "Petrifite" and its products, and to sell raw and calcined magnesite in all countries. It will be seen from the advertisement that all the directors are gentlemen who have had experience in various forms of construction, and their assumption of responsibility is a sufficient guarantee of the financial prospects of the company.

A DISTRICT nurses' home was recently opened in High Lane, Chorlton-cum-Hardy, by the Duchess of Buckingham and Chandos.

THE authorities of North Street Baptist church, Leeds, have just handed over to the committee of the Yorkshire branch of the Baptist Church Extension Fund the sum of 500*l.* out of the proceeds of the sale of their old chapel. The donation is given towards the erection of a new Baptist chapel at Beeston Hill.

THE parish church of St. Mary, Bocking, has been reopened after reparation. The chief work was the restoration of the roof, which had become very unsafe. A new roof has been placed over the old oak one. There have been also new piers placed to the chancel arch, and the whole of the church has been thoroughly cleaned. The work has been done by Mr. Wm. Parmenter, of Braintree.

AT the Batley Technical School a large new wing, to be styled the "Stubley Memorial Wing," is now in process of construction. The cost of the extension, which will amount to 1,500*l.* or 1,600*l.*, is to be defrayed by the Messrs. Stubley. In design similar to the rest of the building, the new wing is to be utilised for the textile classes, the removal of which will considerably relieve the pressure upon the space of the existing building.

A SOMEWHAT singular outbreak of fire was discovered at the parish church, Kettering, early on the morning of the 2nd inst. Constable Campin, whilst passing the George Hotel, in Sheep Street, noticed a strong glare proceeding from the basement of the west front of the church. Upon a closer examination the constable found that the stoke hole, a chamber some

15 feet by 9 feet, was in a full blaze, sticks, coal and other lumber contributing to the fire. The fire brigade were summoned and succeeded in extinguishing the fire in about half an hour, and no serious damage resulted.

A MEETING of the managing body of the Dewsbury Technical School took place on the 1st inst., under the presidency of Mr. T. Richards. The chief business was the consideration of a suggestion by Mr. S. J. Chadwick, president of the school, that steps should be taken towards carrying out a scheme projected some months ago for enlarging the buildings, at a cost of 3,500*l.* The number of students, it was reported, was larger than in any previous year so early in the session, and unless the usefulness of the school be greatly lessened and impaired, it was absolutely necessary that the extension be carried out. It was resolved to appoint a building committee, who are to confer with the architect and bring up a report, to be submitted to a meeting of governors a fortnight hence.

A PECULIAR accident, resulting in some injuries to a young man named Thomas Williams, Penygroes, occurred at the Anglesey Inn, Carnarvon, on the 3rd inst. Williams alighted at the inn and tied a horse, of which he had charge, to the portico. At the request of the landlord he, however, proceeded to undo the halter, but while this was going on the horse was frightened by the booming of cannon near by and plunged forward, pulling the whole portico down with him. Williams was released from beneath the *débris* by the landlord and conveyed to the cottage hospital. The landlord narrowly escaped from injuries which, owing to the heavy weight of the structure, might have proved very serious.

A FIRE broke out about nine o'clock on Sunday night at Lambeth Palace, but was fortunately subdued before it had attained serious dimensions. It occurred in the vestry-room attached to the vestry-hall in Cranmer's Tower, and is attributable to one of the old beams in the chimney becoming ignited. The old-fashioned room became filled with smoke, and prompt but ineffective steps to overcome the mischief were at once taken. As it was obvious that a considerable fire was burning behind the fire-grates not only in the vestry-room but in the lower floor, it was decided to send for the fire brigade, and a messenger was despatched to the Waterloo Road fire station, while a minute or so later someone pulled the Lambeth Palace fire alarm. On the arrival of the firemen the brickwork was cut away on either side, and water poured upon the great beam, which was smouldering. The work of the firemen

was watched with the keenest anxiety by the Palace staff, and the efforts of the brigade were aided by the members of the London Salvage Corps, who came from Southwark Bridge Road, under the direction of Superintendent Bridges. The mischief was effectually subdued by eleven o'clock.

THE new Gresham Baptist chapel, facing Gresham and Barrington Roads, Brixton, erected at a cost of 5,000*l.*, has just been opened for public worship. The former chapel was partially destroyed by fire nearly two years ago, and after some delay in seeking a new site the building committee decided to pull down what remained and rebuild on the old site. The foundation-stones were laid early in the year. The elevations are in the Italian style of architecture, and are of yellow malm bricks with Portland stone dressings. The building consists of a basement for heating purposes, chapel on the ground-floor with entrances from both roads, deacons' and minister's vestries; the seating accommodation is for 475; two entrances and separate staircases to gallery, and also two entrances and staircases to schoolroom, which is placed above the chapel, on either side of which are arranged classrooms for boys, girls and infants; kitchen, water-closet, lavatories, &c. The architect is Mr. J. William Stevens, of 21 New Bridge Street, E.C.

A NEW Baptist chapel, erected at Littlemore, Pudsey, has recently been opened for public service. The chapel will supplant an old and incommensurable building which has been used for Divine service for upwards of forty-seven years and which will now be converted into a Sunday-school. The new edifice has been erected from the designs of Messrs. Hodgson & Farrar, architects, Bradford and Pudsey, and is in a plainly-treated Classic style of architecture, the front being relieved with dressed ashlar piers and moulded cornices. The chapel, which has a gallery running on three sides of it, provides sitting accommodation for about 600 persons. At the east end is a choir and organ gallery, separated from the chapel by a large semicircular arch. The whole of the pews, which are of pitch pine, radiate to the rostrum, thus giving every one a good view. The rostrum, which forms a central feature, is elaborately treated and is of pitch pine and mahogany. There are three vestries on the level of the chapel floor, and advantage has been taken of the fall in the site to get kitchen arrangements, rooms for a Young Men's Christian Association and two classrooms in the basement, but above the level of the ground. The ceiling of the chapel is treated with a lantern running the length of it, relieved with ornamental plaster-work. The artificial

lighting is by means of Stott-Thorpe ceiling lights, the heating is by hot-water on the low-pressure system and the ventilation is on the most approved principle.

THE new science buildings, which have been erected at the rear of the Grammar Schools, Wolverhampton, were opened on the 2nd inst. The foundation-stone of the building was laid in April last by Lord Hatherton, and the work has been carried out by Mr. H. Willcock, of Wolverhampton, from plans prepared by Mr. Stanger, the total estimated cost of the structure and fittings being about 2,000*l.* In nearly every respect will the new erection harmonise with the school, the material used being red brick with stone strings. The building is of two storeys, with an elevation from the ground of 40 feet. On the ground-floor are lecture-room, preparation-room, store-room and balance-room. In the lecture-room is a gallery and there is sitting accommodation for eighty students. The first floor is occupied chiefly with a chemical laboratory and a physical laboratory, the former being for use in teaching practical chemistry or metallurgy, and the latter for practical instruction in the various branches of physics. Each laboratory has workbenches for thirty students, and the building throughout is supplied with all the appliances necessary for the work to be carried on therein.

NEW CATALOGUE.

THE new illustrated catalogue which is being issued by Messrs. Colledge & Bridgen, of Church Lane, Wolverhampton, is a handsome production, as well as a useful book of reference. It contains upwards of 200 pages of well-printed and profusely illustrated matter, every description of door and window furniture and plain and ornamental brass and ironwork being represented by carefully drawn and admirably reproduced sketches. The book, which is printed on thick paper, is substantially as well as ornamentally bound, and all prices are clearly given.

THE plans of the proposed alterations and additions to the Royal Opera House, St. Leonards, prepared by Mr. John P. Briggs, of Effingham House, Arundel Street, Strand, were submitted and passed by the Hastings Town Council on November 19. Mr. Briggs's plans for an opera-house in Tunbridge Wells have been also passed, and it is anticipated operations will be commenced on January 1 next.

TRADE NOTES.

THE County Court House, Galway, is being warmed and ventilated by means of Shorland's patent Manchester stoves, with ornamental tiled sides and with descending smoke-flues, and Shorland's patent Manchester grates.

MR. A. G. BELL, of Sherwood Street, Nottingham, manufactures fire-resisting doors and partitioning, the important principle of which is that they are made in three separate sections, the central one being of asbestos. These doors have been subjected to severe fire tests, with the result that while on one side the woodwork has been completely calcined, the asbestos interlining has effectually prevented the fire, and to a great extent the heat even, from extending through to the other side, which has remained perfectly intact. The following are among the advantages which Mr. Bell claims for his patent doors:—They are non-conductors of heat; are not unsightly, as they can be made to harmonise with the other doors in a building, both in design and material; they are not awkward to open like iron doors, for they are not much heavier than ordinary wood doors; they can be made to close automatically—a most important desideratum in a fire-resisting door; they can be used in many positions where iron doors could not be placed; they will be found valuable in connection with hoists—as by their use as trap-doors to each storey they cut off one floor from another, and thus hinder the hoist acting as a huge chimney; and lastly, they are very moderate in cost.

PLUMBERS' EXAMINATION.

AN examination of master and operative plumbers applying for registration under the National Registration of Plumbers was held on the 4th inst. by the Worshipful Company of Plumbers. There were eighteen candidates present from various parts of London and also from several provincial towns. The tests in workmanship included lead-bossing, pipe-bending and joint-making, and the examination questions included the subjects of roof covering, contamination of drinking water from faulty connections, arrangement of bath, sink and closet wastes, drainage of town houses and disconnection with sewers.

The examiners were Mr. Charles Hudson, chairman of the Board of Examiners; Mr. J. Kemsley, master plumber; Messrs. J. J. L. Scott and J. L. McIntosh, representatives of the United Operative Plumbers' Association of Great

Britain and Ireland; and Mr. C. T. Millis, principal of the education department, Borough Road Polytechnic. Three candidates succeeded in passing the examination in practical workmanship.

THE CITY FIRE.

ON Monday the inquiry into the causes of the great fire in the City on November 19 was opened by Mr. S. F. Langham, coroner. The following evidence about the general character of the buildings was given:—

Mr. G. Vickery, architect and surveyor, 50 Gresham Street, said he was the architect of the premises 28, 29, 30 and 31 Hamsell Street. Nos. 30 and 31 backed on to 15 Well Street, where the outbreak was supposed to have occurred. They were, he said, constructed by Messrs. Mortar for Messrs. Harrison & Smith, the freeholders being the Goldsmiths' Company. There was nothing particular about the construction of the buildings. They had frontages of about 20 feet each, and were divided by party walls from basement to roof. There were four storeys above the ground floor, so that they were six storeys high. In the case of 15 and 18 Well Street there were well-holes or lighting areas. The depth of the land from Well Street to Hamsell Street was about 75 feet, so that the well-holes were necessary in order to get sufficient light into the centre of the buildings. Well Street was, roughly, about 25 feet wide, and Hamsell Street 35 feet or 36 feet, with high buildings on either side. In these circumstances the lighting areas were a necessity if the rooms of the warehouses were to be of any good. These lighting areas extended from the ground floor upwards to the roof, and were surrounded by windows to admit light to the different floors. They were open to the roof, but for the ground floor they terminated in a skylight. The basements were lighted underneath the ground floor by means of glass let into the floor, which was a very common way of lighting basements in the City. The staircases were either teak or pitch pine. There was no stone staircase. Stone was very objectionable for staircases in the case of warehouses of the sort under consideration.

The City Solicitor asked if the buildings were constructed on what was believed to be the principle of fireproof warehouses?

Mr. Vickery replied that they were constructed in accordance with the Building Act and to the satisfaction of the authorities. The different floors were supported on wooden

joists. The span was so short that there was no need of iron girders. It would have been a waste of money to use anything but wood. Wood was used for the floors throughout, but he thought the ceilings and walls were of plaster.

Mr. Brown (intervening) said that in the case of the premises occupied by his firm they were of matchboard.

The City Solicitor asked if the buildings were run up quickly for the purpose of finding tenants?

Mr. Vickery said a building might be run up quickly and yet substantially. No doubt the buildings in question were erected under contract and a reasonable and proper time allowed the contractors. They were not, however, speculative buildings or built by a speculative builder. They were constructed under the supervision of efficient authorities, including the freeholders and the public bodies concerned. They were not, therefore, what was generally understood by the term "run up," although with a heavy ground-rent payable on the property no time was lost in completing them.

The City Solicitor: Then you would not adopt the suggestion that they were jerry-built?

Mr. Vickery: Certainly not. If they were so they would have cracked from time to time, and other complaints would have arisen. At the time the buildings were erected it was a very usual method to use wooden partitions, and he had no doubt that wood was used in the majority of those cases. If a fire broke out on the ground floor the first thing happening would probably be the breaking of the skylight, provided that the fire was of sufficient magnitude. He had not formed any idea at all from any inspection as to whether the fire originated on the ground floor, or as to whether the existence of this well-hole increased the facility of the fire. Of course, when there is a well-hole in a building it becomes to a certain extent a shaft, and to that degree might be considered a danger, though I have not formed any definite conclusion. Two buildings joined by a well-hole might be considered as only one building. It was practically only one. He considered that the premises were reasonably fireproof. They were the usual type of building erected twelve years ago; in fact, he might say that 99 out of every 100 buildings were similarly constructed. He had designed many such buildings, and this was the first fire of any magnitude—he might even say the first fire—that had occurred in any of them. Matchboard ceilings and walls were objected to by the insurance companies, and at the present time it was considered that warehouses were better when finished with plaster. The well-

hole was absolutely necessary, as they had in this case a warehouse badly lighted from Hamsell Street and Well Street, and the buildings must be lighted or they were useless. As to the staircases, a good old oak staircase would have been best, but they were very expensive and he doubted whether he could get them if he wished. Staircases made of oak 100 years old would stand for hour after hour against the fiercest of flames, while a stone staircase would collapse and fly into fragments. Stone staircases in such cases were a delusion. The parapets which divided the two warehouses in question were about 18 inches or 2 feet from the gutter, while a railing was carried along the top of the parapet to make ingress and egress still easier. All this mischief, he continued, has been the fault of narrow thoroughfares. Give us wide thoroughfares and we shall get safer buildings and not need lighting shafts. The architect might contrive and plan and the builder may construct, but the tenant wants to occupy and stores the buildings up on every floor with combustible goods, and it is impossible to make a building fireproof under such circumstances.

THE NEW THEATRE ROYAL, DUBLIN.

THE reconstructed Leinster Hall, Dublin, which will henceforth be known as the Theatre Royal and Opera House, is now rapidly approaching completion, and bids fair to rank with the handsomest theatre in the kingdom. The frontage has been altered by the erection of a graceful portico on the site of the verandahs of the Leinster Hall. The pediment is supported on light Ionic columns, and is surmounted by a handsome Italian balustrade. This structure rises to about half the height of the whole frontage, to the attractiveness of which it materially adds. The entrance to the balconies and boxes will be from Hawkins Street. The vestibule of the Leinster Hall has been largely utilised, and from that point two marble staircases, one on either side, lead up to the dress circle. In large recesses on this landing mirrors will be placed, which, under the electric light, will render the scene a gay and animated one. The ceiling of the Hawkins Street entrance is elaborately worked out, the emblematic painting-work having been done by an Italian artist, who has also done similarly beautiful work on the lofty ceiling of the auditorium.

The stage is amply capable of affording accommodation for the presentation of great spectacular displays. It is 64 feet square, and the height from the floor to the gridiron roof is 60 feet,

AGENTS APPOINTED IN ALL LARGE TOWNS.

affording great facilities for scenic displays. In the matter of lights in this part of the house a distinct novelty has been introduced. In most theatres it has hitherto been the practice to work the lights from the prompt entrance, but here they will be worked from a suitable platform over that entrance, thus avoiding any risk of fire. With regard to the general lighting of the house, the arrangements are excellent. A powerful steam-engine is in position on the Hawkins Street side, and is already generating electricity for the use of the workmen engaged in the building, and there are also provided a number of accumulators, which will supply light for five hours; but lest anything might go wrong with this arrangement, the Theatre Royal will be connected with the Corporation works in Fleet Street, and there will also be a supply of gas to be used when required. Fire in any part of the building is almost an impossibility, and the asbestos curtain, in the remote chance of anything in the nature of fire taking place on the stage, would effectually protect the auditorium. The "flies" are unusually spacious, and those engaged there will have ample room to attend to their special business.

The auditorium is 80 feet in depth by 64 feet in width, and the inside width is 31 feet. The pit is of great dimensions and will accommodate a vast number of people, while a decided advantage for persons frequenting that popular part of the house will be found in the circumstance that the seats here incline towards the stage, so that the view of those in the back portion of the pit is not at all interfered with. The work in the dress circle and upper circle as well as in the gallery has been completed in splendid style. Two handsome boxes on either side behind the dress circle have been provided, from which an uninterrupted view of the stage will be obtained. A fine promenade behind the dress circle presents a point of vantage for a thorough view of the stage. The old foyer in the Leinster Hall is being transformed into a saloon for visitors to the dress circle, while one portion of it, separated from the saloon, will be devoted to the providing of tea and coffee for ladies, and another part, also separated from the saloon-bar, will be used as a board-room. The box intended for His Excellency and the Viceregal party is being fitted up on a scale of great magnificence, and all the other boxes are being luxuriously upholstered. There will be a saloon for every portion of the house. For the *artistes* engaged the dressing-rooms are numerous, and they are all fitted up with all the necessary accommodation. The opening performance will take place on Monday next.

SANITARY INSPECTORS' ASSOCIATION.

A MEETING of the Worcestershire and Midland Counties Sanitary Inspectors' Association was held in the board-room at the Evesham Workhouse on the 4th inst. Mr. G. H. Fosbroke (medical officer of health for Worcestershire) presided. Mr. Harvey read a paper on "Village Drainage," and afterwards gave a practical demonstration of levelling. In the course of the discussion Mr. Brookes spoke on the question of air-inlets in the line of drains, about which a discussion had arisen in Birmingham. The position of the air-inlet should be carefully selected, and in no case should it be placed over an intercepting trap. He did not think it was right to place a syphon upon every drain connection; the fewer syphons they had the better. Mr. Hillyard urged that no portion of a drain should be covered in unless it had been thoroughly tested with water. Referring to the point which had exercised the authorities in Birmingham, Mr. Fosbroke urged the importance of syphons being properly set and constructed, and said if they did not have an intercepting syphon and an inlet how were they going to get fresh air into the drains? Mr. Fosbroke afterwards spoke upon isolation hospitals, and explained the plans of a hospital which had been approved. Local authorities were enabled to provide such hospitals as far back as 1875, and some authorities then set to work and provided them—at Alcester, for instance, where the hospital had given most satisfactory results ever since. Mr. Fosbroke also spoke of the good results obtained from the King's Norton Hospital. There were many places where hospitals were required, but nearly the whole of the authorities of the county were now considering this question. Mr. Fosbroke explained the friction which had arisen between the Local Government Board and the county councils of Worcestershire, Derbyshire and Staffordshire, owing to the demands of the Local Government Board. In the case of Malvern the Board required that in a hospital of twenty beds eleven bedrooms should be provided for the staff, but a more absurd case referred to Derbyshire, where the Board required nursing accommodation for sixteen, and the hospital was only one of sixteen beds. Mr. Hare, an architect of great experience, had conferred with the medical officer for Staffordshire and himself with the view of inducing the Local Government Board to reduce their demands, and these plans, which provided for twenty beds and six bedrooms, had now been sanctioned by the Local Government Board.

In the course of a general discussion, Mr. Fosbroke said the Tewkesbury Rural District Council was the only district authority in the county so far behind the times as not to have adopted the Notification Act.

PAVEMENT LIGHTS IN BIRMINGHAM.

OUR attention has been called, says the *Birmingham Daily Post*, to certain regulations which the authorities have lately been enforcing in Birmingham with regard to the lighting of basements by the insertion of glass slabs in the pavement, which regulations, it is complained, are a serious curtailment of the privileges which property-owners have hitherto enjoyed. Our information is that prior to the retirement of Mr. W. Till from the office of city surveyor the rule was to allow pavement lights a foot wide along two-thirds of the frontage in cases where they were desired, the Corporation exacting no payment and making no special conditions. The result has been that a very large number of business premises have been so planned as to admit of the use of the basements for offices, show-rooms and so forth, the value of the property being thereby considerably enhanced, and the rates being proportionately enriched. Some time ago it was intimated to persons who were about to erect properties on these lines that the pavement lights would only be sanctioned subject to payment of 5s. per annum for each light of 6 feet by 2 feet, the arrangement to be terminable at three months' notice. Agreements to this effect were entered into in some cases; but other persons concerned have taken the view that not only is the exaction of a rental for the use of the pavement light illegal, but that the reservation as to the continuance of the light seriously vitiates the property-owner's title, rendering the leasing of basements so precarious as to leave no alternative but to revert to the primitive cellar or comparatively dark storeroom.

This view has been forcibly put to us by several professional gentlemen who are in a position to speak with some authority as to the probable effect of the new regulations from the building-owner's point of view. They say that, apart altogether from the depreciation in the value of the property to the extent of the charge now imposed, owners will not consider themselves justified in going to the expense of constructing basements and entering into leases with tenants for their occupation, if they are under liability to forfeit their pavement lights at the caprice of another surveyor or newly-constituted public works committee. Building-owners have, of course, the option of setting back their frontages so as to allow of the areas being constructed on their own land, but it is urged that this would not only involve the sacrifice of a portion of the site, but might lead to many ugly irregularities in the building line. Pavement lights are unquestionably viewed with anything but favour by many people, on the ground that they are a source of danger to pedestrians, particularly in wet weather. The critics of the public works committee point out, however, that this does not enter into the present controversy, the only dispute being with regard to the payment of rental and the reservation as to withdrawing the permission. They say, moreover, that it is recognised in all large cities that the advantages of pavement lights far outweigh any possible disadvantages; and, further, that any misgivings which may be felt concerning the insecure foothold they afford, are conclusively answered by the fact that the doorways of many shops in Birmingham are paved with prepared glass, which admits the light to the apartments below. Particular stress is laid on the argument that the rateable value of business properties is greatly increased by the utilisation of basements for offices, shops, &c., and that while the public purse may benefit by the rents received for such pavement lights as are put in, it will lose much more through the check imposed on the erection of premises with good basement accommodation. One correspondent suggests that it would make an interesting study for the assessment committee to calculate the benefit they have derived up to the present time from such rating, and the loss which is likely to accrue if the public works committee adhere to their present course of action. He adds that it is felt by many who are in a position to know, that a serious blunder has been made in municipal policy. It is said that the new regulations are necessary in view of the possibility of the public services demanding the laying of more pipes or wires under the streets in the future. The architects and surveyors reply that the sewers, gas, water and electric mains do not occupy on an average more than a fifth of the road space. A concrete case has been brought to our notice by way of illustrating the effect which the new regulations have on building enterprises. In the improvement block of buildings about to be erected on the site bounded by Cannon Street, New Street and Needleless Alley, it was proposed to construct good basements, lighted and ventilated on the area plan. The promoters of the scheme found, however, that the necessary pavement lights at 5s. each would involve an annual charge on the property of 15%, thus reducing its full value by 500%. The solicitors advised that apart from this

charge the owners would be so hampered by the condition as to cancellation of the pavement lights that it would be folly to enter into the agreement required by the authorities. It almost appeared that the scheme would be abandoned, but a compromise was arrived at whereby the building line was modified and certain old rights of lighting were exchanged for new, the result being that the scheme was proceeded with, though with a serious reduction of the pavement lights originally intended. The feeling that the authorities are not only acting very inconsiderately with regard to the property-owners, but are levying tribute and usurping rights in a way that the law never contemplated, is so strongly held by some of those affected that it is hinted that the merits of the dispute may be put to the test before a legal tribunal.

In order to ascertain the official view of the matter we have communicated with the city surveyor (Mr. John Price) and the town clerk (Mr. E. O. Smith), who have courteously explained the bearings of the case as concerns the public at large. The city surveyor, whose department is primarily interested, states that the regulation has been adopted in order that the Corporation may receive an equitable return for expense to which they are put in connection with pavement lights, and also with a view to preserving the rights of the public in regard to the footpaths and the space beneath them. The new arrangement is in some respects only tentative, and it is not improbable that it will be modified if it appears to the committee to operate oppressively where properties with extensive frontages are concerned. Mr. Price contends, however, that these pavement lights, though valuable to private individuals, are a doubtful boon from the point of view of the general public, and states that, apart from the fact that their surface is slippery, they entail expense on the rates. There is the preliminary cost of drawing up and stamping the agreement, with incidental correspondence and the supervising of the construction and maintenance of the pavement lights, while the iron framework in which the glass is enclosed causes the pavement to wear away round its edge, thus entailing frequent renewal. As to the necessity of making the concession of pavement lights terminable at three months' notice Mr. Price is very decided. He says it is obviously not in the public interest that the right to the user of the footpaths and the space underneath should be thrown away by the Corporation, as if it became necessary at any time to carry pipes, say, under the pavements, the conciliation of vested interests would become a very costly affair. Mr. Price demurs to the statement that the right to introduce pavement lights was granted as a matter of course prior to his coming to Birmingham. He says permission was sometimes refused altogether, and what he has done has been to put the matter on a systematised basis, so that no one can complain that another person is having preferential treatment. He states further that charges are imposed in the same way in Liverpool and other towns, but he will not pledge himself that it is a regular practice, because he knows places where the authorities will not sanction pavement lights on any consideration. Finally, Mr. Price holds strongly that some limitation of these privileges is desirable in Birmingham, and says in effect that it is bad tactics on the part of the gentlemen who "want something for nothing" to run the risk of overreaching themselves.

The town clerk being consulted by a representative of the *Daily Post* on the legal aspects of the question, had some hesitation in giving an opinion which was not sought by the committee concerned. He, however, went so far as to say that his view was that each case in which pavement lights were desired should be dealt with upon its merits, regard being had to the public interests involved. The paramount duty of the Corporation in the matter was to maintain the rights of the general community; and the Public Health Act and the Birmingham Corporation Consolidation Act 1883 gave them the necessary control over both the carriageway and footpath, not only so far as the surface was concerned, but in reference to subterranean works. These matters were expressly made subject to the approval of the local authority by section 26 of the Public Health Act and section 17 of the Consolidation Act. The town clerk recognised that the Corporation were not entitled to exact any substantial rent for pavement lights, because only a limited right was given to the local authority; but he regarded the 5s. now charged as very little more than an acknowledgment, the object being to preserve evidence of the fact that the public works committee had in a particular instance allowed a person to do that which was forbidden by the general law, save by express permission. When it was pointed out to the town clerk that 5s. per light meant a considerable item on a large property where pavement lights were desired throughout the whole frontage, he said he did not understand that anything more than one small acknowledgment would be demanded for the whole series of lights, adding that the Corporation recognised, of course, that they had no right to sell parts of a public footpath. These are the two sides of a thorny question, so far as we have been able to ascertain them, and the statements *pro* and *con* will perhaps assist our readers

to arrive at an approximate estimate as to how far the authorities have succeeded in reconciling the claims of private enterprise on the one hand with the public interest on the other.

MUNICIPAL BUILDINGS, SURBITON.

The following is the description by Messrs. Forsyth & Maule of their design, which has been accepted by the Council, for the new municipal buildings, Surbiton:—

Position and Site.—The design shows the building placed parallel with Ewell Road, and on the building lines. On the south boundary a space of 7 feet is kept for boundary fence to take advantage of the suggestion of placing windows on this side, and to insure an air space all round. Double wrought-iron gates with brick piers are indicated in the Ewell Road, allowing for a "drive in" to the front door of offices, and a gate is shown in Berrylands Road for caretaker, tradesmen, &c.

Arrangement of Plan.—A vestibule leads to the hall and main staircase. To the left on entering the hall are the doors of the collector's and surveyor's departments, which are easily accessible. The surveyor's department has a north aspect, as being most suitable for drawing purposes, a small third room is arranged between the general and private offices, heated by a radiator, and a good strong room for plans is placed in the former. The collector's office has a small safe. The caretaker's office and staircase is put on this side, being the most convenient for Berrylands Road. The stairs run up from basement (containing heating chamber and coal cellars) to second floor, having door leading therefrom to main hall and first floor landings, to facilitate cleaning operations. A coal lift occupies the centre space of these stairs, and supplies the various floors from basement. To the right on entering are the council clerk's general and private offices, the registrar's office, the medical and sanitary, private and general offices. Strong rooms are given to the council clerk's and registrar's departments.

First Floor.—On the plan are shown the council chamber, two committee-rooms, waiting-room, cloak-room, main and the caretaker's staircases, &c. The council chamber provides ample space for the number of councillors, officials and reporters, and space for deputations in addition. The waiting-room is shown large enough to accommodate deputations. The committee-rooms are arranged in the lobbies near the doors of the council chamber, affording ready communication with the latter.

Second Floor.—The whole of the caretaker's accommodation required is placed on this floor.

Materials (externally).—The elevations have a simple treatment in red brick and stone. The facing bricks to be of a good warm colour and sound, and laid in English bond, with a wide joint weather painted, the general walling to be in good approved stocks. The stonework to be in best brown Portland, and cornices covered with lead. The roofs to be boarded, battened and felted, and covered with approved green Westmoreland slates, finished with lead hips and ridges. The lead flats where shown to be covered with 7-lb. lead checks, 6-lb. lead, and flashings in 5-lb. lead.

Internally.—The floors in entrance hall and vestibule, plain marble floors in large squares, floors in offices to be yellow deal in narrow widths, council chamber and committee-room floors to be pitch pine in narrow widths, and all other floors on first and second floors to be deal. Basement floors to be cement. All staircases to be stone with wrought-iron handrail and balusters. All walls and ceilings plastered, and all angles in Keene's with mouldings and architraves where shown. The fireproof to be of breeze concrete. The whole of the joinery throughout to be in deal, painted with four oils, and with simple mouldings. The council chamber to have panelling round same to height as shown, all in deal and painted. All walls to be distempered. Windows to have deal frames and metal casements and fastenings, and glazed with quarter-inch British polished plate to offices and council chamber, and 21-ounce sheet elsewhere.

Lighting.—To be by gas laid on from meter, in the absence of electric lighting in Surbiton.

Heating.—Heating generally to be by fireplaces, but council chamber, hall, staircase, surveyor's waiting-room and cloak-room to be heated by radiators, supplied by low-pressure boiler in heating chamber; 12 feet super of heating is provided for every 1,000 cubic feet of air.

Ventilation.—Fresh air is admitted in addition to doors and windows to the offices, council chamber and committee-rooms by means of air inlet brackets, and further to council chamber by air gratings behind radiators. An exhaust ventilating trunk and large air-pump ventilators placed in turret is provided in ceiling of council chamber for the extraction of vitiated air.

Estimates.—The dimensions and heights of the various rooms are generally kept under the suggested sizes without, however, prejudicing their working capacity. It was found necessary to do this in order to approximate the cost of building

to a sum allowed, giving at the same time all the accommodation asked for. For this same reason the whole of the detail inside and out is intended to be of the simplest and plainest character. The total number of cubic feet is, main building, 116,127; basement, 5,175; main building at 9 $\frac{1}{2}$ d., 4,596l. 13s. 10d.; basement at 5d., 107l. 16s. 3d.; boundary walls and gates, 300l.; total, 5,004l. 10s. 1d.

The accepted design was placed second by the assessor, Mr. E. W. Mountford. The first place was given to a design by Messrs. W. Wimperis & H. S. East, and the third to the design by Messrs. W. E. Hewitt & A. H. Ryan Tenison.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on Monday evening, December 6, Mr. G. Maxwell Lawford, president, in the chair, a paper was read by Mr. Reginald E. Middleton, M.Inst.C.E., entitled "The Pollution of Water and its Correction."

The author first referred to the recent disastrous epidemics of typhoid fever in Maidstone and King's Lynn, which have forced upon the attention of the public the necessity for protecting our water supplies from pollution. In Maidstone up to this date 1,770 persons out of a population of 32,145, or 5.5 per cent., have been attacked by the disease, while the deaths have numbered 119, or 6.72 per cent. of the reported cases. No doubt many of the cases are due to secondary infection, but that the primary cause was polluted water seems to be certain, and without the presence of the germs of disease in the water supply there could not have been any secondary effects; the whole of the lamentable loss and suffering must therefore be attributed to one cause. An inquiry is, it is understood, to be held; it is not possible, therefore, at this juncture, to offer any opinions on the subject beyond stating the broad fact, which seems to be admitted, that certain of the sources of water supply were contaminated.

From time immemorial running water has been used for two separate and antagonistic purposes, namely, those of water supply and removal of refuse, and it is a curious fact that the earlier sanitary legislation is directed towards the removal of refuse by sewerage or otherwise, rather than to the provision of pure water, and that up to the present date the latter is permissive, the former compulsory. Perhaps those who remember

the state of the Thames opposite the Houses of Parliament in the fifties, and the vile smells which emanated therefrom, may conclude that the Legislature was led by its collective nose, and that we may thank that evil-smelling river for providing us, in many cases, with sewers before we had water wherewith to flush them. It is necessary, under these circumstances, to enunciate the truism that water is provided in the first place for dietetic and cleansing purposes, and that the removal of refuse by its means must be subordinated to this first and most important requirement.

Statistics prove that the first element of aggregated health is a pure and sufficient water supply, and we may congratulate ourselves that we are provided with this desideratum, and that the death-rate of our vast Metropolis is only 18.6 per 1,000 against 18.9 for the thirty-three principal English towns. Notwithstanding that the importance of pure water is now so well understood, it is by no means easy to secure it; the Rivers Pollution Act, 1876, which up to the year 1893 was its only protection, except in a few isolated cases, is so elastic that it is practically impossible to enforce its provisions within any reasonable time unless the authorities themselves are anxious to comply with its meaning.

It must be presumed that there is no such thing as pure water in nature; even rain-water collects impurities, harmful or otherwise, from the atmosphere, and has ceased to be pure before it touches the ground, by which it is further contaminated with animal, vegetable or mineral matter, the amount varying with other conditions until it is found that the washings of a street may be more highly polluted than the contents of a sewer. When the water touches the earth, if the surface be permeable, reaction takes place, and the soil tends to remove the animal and vegetable impurities collected in the water and to substitute others of a mineral character. Water which has percolated through clean soil, and has reached its underground reservoir, has parted with nearly all but its mineral impurities.

Deep well water, though frequently hard, is, for the above reasons, generally free from the presence of many micro-organisms. This very condition, however, lays it open in a remarkable degree to the attacks of pathogenic germs, if any should find access to it. The ordinary organisms present in water appear to be at war with those of dangerous character, and in their absence the latter have a free field. The same thing may be said of moorland waters drawn from rocky districts, while much moorland water contains vegetable matter, derived from peat, which renders the water unsightly, and is

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE

PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact it will Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish. Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION.

apt to produce diarrhoea in those unaccustomed to its use. The great polluting element is man, whether considered as an individual, or an aggregation of individuals, or as a manufacturer; animal pollutions hold quite a secondary place.

The most serious forms of pollution generally arise from the sewage works of towns or villages, many of which are so situated that the acquisition of land suitable for the satisfactory disposal of sewage and the production of a relatively pure effluent is difficult; the sewage farms or disposal works are seldom of sufficient extent to deal with more than the dry weather flow, therefore in wet seasons the average is only very partially purified, for dry soil is the essence of the purifying process. Moreover, it is generally accepted that most of the cleansing takes place in the first few inches, decreasing with the depth, and ceasing, or nearly so, when the line of saturation is reached. Many shallow wells, and some deep ones, become contaminated from neglect of this knowledge, the ground around them becoming sodden with clear water as well as with slops and manure, or they are polluted by leaking drains or cesspools, which, being below the surface, are only slightly affected by soil. No chemical treatment of sewage is by itself sufficient to produce an effluent of satisfactory purity. The author believes that—as he stated in a paper communicated to the Congress of Hygiene, held in Buda Pesth in 1894—the solution of the problem is to be found in some form of artificial filtration, accompanied and aided by biological action. This system also offers immense advantages in dealing with the sewage of large towns in a cheap and effectual manner, and obviates the necessity for the erection of large sewage-farms, as well as of large outfall works. It must, however, be worked as carefully as are the filters of a large water-supply, and this is not possible in small villages, the sewage disposal works of which are frequently in a disgraceful condition.

For the prevention of pollution, and as protection against it, there may be said to be three lines of defence. First, by the introduction of clauses into an Act for the prevention of pollution, something on the lines of clauses 93 and 94 of the Thames Conservancy Act of 1894. Secondly, by sedimentation and oxidation in storage reservoirs, by which means, after some twelve days' storage, from 83 per cent. to 96 per cent. of the micro-organisms are removed; and, thirdly, by filtration through sand, which retains an average of 99·6 per cent. of the remaining bacteria. Thus, out of an average number of 24,000 microbes per cubic centimetre contained in the said river water, only thirty-four find their way through the filter beds.

Because, however, two good lines of defence are provided, it is no reason why rivers should be polluted; on the contrary, their existence proves the necessity for other precautions and prevention our first line of defence, which, as we know, is better than cure and should be insisted on.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

27332. Colin Henry Moon, for "Improvements relating to the discharge of liquids from tanks, basins, bottles and other vessels, pipes and receptacles."

27423. Donald Davidson and William Ritchie Cumming, for "A fireclay brick fireplace."

27430. George Cameron, for "Improvements in fixed and portable electrically-driven circular-sawing, moulding, rebating, planing and surfacing machinery."

27448. Charles William Lyon Thornhill Lees, for "Improvements in door knobs."

27492. William Adolphus Smyrk, for "Improvements in knockers."

27526. Ebenezer Arthur William Jefferies, for "Improvements in hydraulic coping or shearing machines."

27584. John William Deans, William Dunn Foster and Arthur Frank Stray, for "Improvements in or relating to drilling machines, back-centres of lathes or the like."

27658. Herbert Scales, for "Improvements in funnels."

27667. Sandham Francis Symes, for "Improvements in gates."

27817. Ambrose Roberts, Edwin Thomas Ball and Walter Henry Bangham, for "Improvements in apparatus for the manufacture of ceramic and other tiles."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{3}{16}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

BELPER.—Jan. 8, 1898.—The Belper Rural District Council offer premiums of 15 guineas and five guineas for the two best sets of plans and reports for Crich water supply. Mr. Joseph Pym, clerk, Belper.

BELPER.—May 1, 1898.—The Belper Urban District Council offer premiums of 50 guineas and 25 guineas for the two best schemes of sewage disposal. Mr. Joseph Pym, Urban District Council Offices, Belper.

BOOTLE.—Dec. 31.—The Corporation invite competitive designs of a central fire station, firemen's dwellings and district police station. Mr. J. A. Crowther, borough engineer, Bootle.

PORT ELIZABETH.—Feb. 15, 1898.—The public library committee offer prizes of 100 guineas and 50 guineas for designs for a new library building. Messrs. Wm. Savage & Sons, 85 London Wall, London, E.C.

CONTRACTS OPEN.

ALNMOUTH.—Dec. 22.—For erection of a house in Argyle Street. Mr. Geo. Reavell, jun., architect, Alnwick.

BARKING.—Dec. 21.—For erection of an electric-light station at the rear of the public offices, East Street. Mr. C. J. Dawson, Public Offices, Barking.

BELFAST.—Dec. 21.—For repairs to the dispensaries at Rumford Street, Glengall Street and North Queen Street. Messrs. Young & Mackenzie, architects, Donegall Square East.

BELFAST.—Dec. 23.—For erection of a fire-brigade station in Whitla Street. Sir Samuel Black, town clerk.

BIDEFORD.—Dec. 28.—For alterations and repairs on the post office premises. Mr. R. T. Hookway, architect, Bideford.

BLACKPOOL.—Dec. 22.—For construction of underground urinal, Station Road, South Shore. Mr. J. Wolstenholme, borough surveyor, St. John's Market Buildings, Blackpool.

BRADFORD.—Dec. 20.—For fitting-up a restaurant in Kirk-gate. Messrs. Milnes & France, architects, 99 Swan Arcade, Bradford.

BRITON FERRY.—Dec. 20.—For erecting a villa residence. Mr. H. Alex. Clarke, architect, Briton Ferry.

BURLEY-IN-WHARFEDALE.—Jan. 13.—For erection of National school for 500, with out-offices, boundary walls, &c. Mr. Ed. C. Brooke, architect and surveyor, 4 Huddersfield Road, Brighouse.

BURNLEY.—Dec. 29.—For extensions to the electric-lighting station. Mr. G. H. Pickles, Town Hall, Burnley.

BURY.—For twelve houses off Bolton Road, Elton. Mr. D. Hardman, architect, Silver Street, Bury.

BURY.—For erection of five dwelling-houses at Littlewood Cross, Bury. Mr. Thos. Nuttall, C.E., architect, 20 Market Street, Bury.

COLCHESTER.—For erection of business premises in Long Wyre Street. Mr. Chas. E. Butcher, architect, 3 Queen Street, Colchester.

CORNWALL.—For building a hotel at Padstow. Messrs. Crickmay & Sons, architects, 13 Victoria Street, Westminster, S.W.

DEWSBURY.—Dec. 20.—For long chimney in Back Webster Street. Mr. John H. Brearley, architect, Hanover Street, Batley.

DEWSBURY.—Dec. 23.—For erection of ten through houses, outbuildings, boundary walls, &c., in Greenwood Street. Mr. Thos. W. Speight, architect and surveyor, 28 Boothroyd Lane, Dewsbury.

FLINTS.—Dec. 31.—For erection of school buildings in Victoria Road, Mold. Mr. F. Bellis, architect, Bangor.

FRINTON-ON-SEA.—Dec. 31.—For erection of a school to accommodate 150 children. Mr. S. T. James, architect, Frinton-on-Sea.

GREAT LEIGHS.—Dec. 22.—For erection of a pair of cottages. Mr. George E. Clare, architect and surveyor, 66 Duke Street, Chelmsford.

HALIFAX.—Dec. 31.—For alterations and additions to Moorside school, for the School Board. Mr. Joseph F. Walsh, architect, Lancashire and Yorkshire Bank Chambers, Halifax.

HALIFAX.—Dec. 31.—For additions and alterations to Akroyd Place school, for the School Board. Mr. Joseph F. Walsh, architect, Lancashire and Yorkshire Bank Chambers, Halifax.

HUDDERSFIELD.—Dec. 23.—For erection of three shops and two dwelling-houses in Morley Lane, Milnsbridge. Mr. J. Berry, architect, 9 Queen Street, Huddersfield.

ILKLEY.—Dec. 22.—For erection of four houses in Wilton Road. Mr. E. Barton Johnson, architect and surveyor, Ilkley.

IRELAND.—Jan. 1.—For erection of manager's residence, adjoining creamery at Abbeydorney. The Manager, Creamery Offices.

IRELAND.—Dec. 21.—For erection of a dispensary house in the village of Derrygonnelly, Enniskillen. Mr. Richey Wilson, Board-room, Workhouse, Enniskillen.

BERRY, CAMPBELL & CO.

WARMING & VENTILATING ENGINEERS,

62 WATLING STREET, QUEEN VICTORIA STREET.

Heating by Hot Water, or High or Low Pressure Steam, expeditiously carried out on the most approved principles. Special attention given to Private Residences.

ESTIMATES FREE.

KEYHAM.—Dec. 24.—For alterations at St. James's School. Rev. R. J. Bond, St. James's Vicarage, Keyham.

LEWISHAM.—Jan. 13.—For erection of buildings to accommodate about 800 persons, together with the necessary administrative offices, at Slagrove Farm, Ladywell. Messrs. Newman & Newman, architects, 31 Tooley Street, London Bridge, S.E.

LONDONDERRY.—For erection of a dwelling-house. Messrs. R. H. McElwee & Co., architects, 9 Carlisle Road, Londonderry.

LOWESTOFT.—Dec. 22.—For erection of a house, &c., at Blundeston. Mr. Sidney Rivett, architect, 5 South Quay, Great Yarmouth.

MAIDSTONE.—Dec. 20.—For alterations and additions to the Council's offices, Fair Meadow. Mr. H. Monckton, town clerk, King Street, Maidstone.

MANCHESTER.—For completion of laundry buildings, Chester Road and Thomas Street, Stretford. Messrs. Johnstone Bros., architects, 39 Lowther Street, Carlisle.

MANCHESTER.—Dec. 28.—For erection of thirty-two two-storey tenement buildings fronting a new street between Cornwall Street and Spittal Street, and eighteen cottages fronting George Leighton Street. City Surveyor, Town Hall, Manchester.

MANCHESTER.—Dec. 28.—For erection of thirty-six two-storey tenement buildings fronting Chester Street, Marsland Street and Hulme Street, Hulme. City Surveyor, Town Hall, Manchester.

MORLEY.—Dec. 23.—For erection of stables, sheds, store-rooms, &c., Corporation Street. Mr. M. H. Sykes, borough surveyor, Town Hall, Morley.

MORLEY.—Dec. 22.—For erection of two houses in Park Parade. Mr. T. A. Buttery, architect, Queen Street, Morley.

MYNYDDISLWYN.—Dec. 20.—For erection of two additional classrooms and other works at the Pontllanfraith school. Mr. George Rosser, architect, Abercarn.

NORTHUMBERLAND.—Dec. 23.—For extension of school buildings. Mr. J. Weightman Douglas, The Willows, Alnwick.

REDCAR.—Dec. 20.—For erection of eleven houses. Messrs. Hutchinson Bros., builders' merchants, Grange Road West, Middlesbrough.

SALISBURY.—Jan. 4.—For erection of engine-shed and retaining wall and construction of three engine-pits, for the

Great Western Railway Company. Mr. G. K. Mills, secretary, Paddington Station.

SCOTLAND.—Dec. 21.—For erection of a villa in Aberlour. Messrs. A. & W. Reid & Wittet, architects, Elgin.

SCOTLAND.—Dec. 25.—For erection of a manse at Ardgour. Messrs. L. & J. Falconer, architects, Fort William.

SOUTHAMPTON.—Dec. 28.—For constructing a public convenience at Northam. Mr. W. B. G. Bennett, borough engineer, Municipal Offices, Southampton.

SUSSEX.—Dec. 23.—For erection of a house at Billingshurst. Mr. William Buck, architect, 60 West Street, Horsham.

TIPPERARY.—Dec. 20.—For erection of two new schools, viz. male and female, offices and halls, at the Cross of Shrenwell. The Rev. Dr. O'Neill, P.P., Lattin.

WALES.—Jan. 1.—For constructing abutments, wing walls, piers, &c., of proposed bridge, forming of road approaches and fencing the same, taking down existing bridge, &c. Mr. R. Lloyd Williams, county surveyor, Denbigh.

WALES.—Jan. 25.—For erection of a school for girls, and alterations to existing boys' school. Mr. H. Teather, Andrew's Buildings, Queen Street, Cardiff.

WALES.—Dec. 20.—For erection of a school at Pinged. Mr. Richard Williams, architect, Burry Port.

WALMER.—Jan. 5.—For erection of public convenience near Strand Promenade, and fencing and levelling site of new recreation ground, Campbell Road. Mr. J. E. Turner, 2 Cornwall Road, Walmer.

WEST BURTON.—Dec. 20.—For erection of a Wesleyan chapel, school, &c. Mr. Wm. Lawson, West Burton.

WESTON-SUPER-MARE.—Dec. 28.—For erection of two cottages at Woodspring. Messrs. Price & Wooler, architects, Waterloo Street, Weston-super-Mare.

At a meeting of the water committee, plans and estimates were approved for the erection of a new house at Craigmaddie Reservoir, in lieu of Invergyle House, Loch Katrine, for the use of the town-councillors during the summer season, and for the use of several officials. The total cost comes to 3,000*l*.

BUILDING AND BUILDERS.

It is proposed to carry out, at a cost of about 4,000*l.*, a scheme of extension in connection with St. Cuthbert's Roman Catholic church, Withington.

THE foundation-stone has been laid of the new mission church which is being erected in St. Peter's Place, Edinburgh, in connection with St. John's Episcopal church.

THE reopening of St. Mary's Church, Plumtree, after restoration and the consecration of an addition to the churchyard, took place on the 10th inst.

ON Sunday last at St. Thomas's Church, Barras Bridge, Newcastle, the Bishop of Newcastle dedicated a new font erected by the congregation in commemoration of the Queen's Jubilee.

PLANS for the erection of a new mission church adjoining Peel vicarage, Little Hulton, have been approved by the Little Hulton District Council. A stone tower is being erected at Peel Church, the cost of which will amount to 1,200*l.*

THE foundation-stone of a new Conservative Club house in the High Street, High Wycombe, was laid on the 10th inst. The building will be of Late Gothic style in brick, stone and tile, having a frontage of about 26 feet to the main street. On the ground floor are provided large smoking-lounge and bar, with stewards' room, lavatories and offices in the rear. On the first floor, reading-room, lofty billiard saloon for two tables and committee-room, and on the second floor five rooms and offices for steward's residence. The cost of the site and building will be about 1,600*l.*, and the contract for the building has been given to Mr. G. H. Gibson, of High Wycombe, at 92*l.*. The architect is Mr. Arthur Vernon, of 29 Cockspur Street, London, and Wycombe.

New business premises are in course of erection in Moor Street, Birmingham, for Messrs. Coleman & Oldland, wholesale clothiers. This building will have a frontage of about 60 feet and depth of 50 feet, the ground-floor nearly covering the whole area of land, but having "set-offs" at back with glazed top-lights. It will be a four-storey erection, and mainly constructed with steel girders, cast-iron columns, and strong brick in cement piers. The principal rooms will have floors and ceilings covered with stained and varnished matchboarding. There will be a wide gateway, separate entrances for proprietors and workpeople, lift running from basement to top floor and efficient sanitary arrangements. The building will be heated

THE works committee of the Glasgow Corporation Water Department at their last meeting had under consideration tenders for the supply of 700 tons of pipes. The following offers were received:—Messrs. Wood (America), 3,25*l.*; Laidlaw, 3,970*l.*; Stewart, 4,135*l.*; Strang, 4,136*l.*; and McLaren, 4,205*l.* Messrs. Wood's tender was for 12 feet lengths instead of 9 feet lengths as required by the department. It was decided to accept Messrs. Laidlaw's tender, being the lowest for the length of pipes specified.

AVOID FREEZING OF PIPES, ETC.

Blue Cape Asbestos Covering, the Lightest, most Durable, and most Effective Removable Covering extant, to prevent Freezing of Pipes, Cisterns, &c., &c., in Private Houses and Public Buildings.

Messrs. JOHN BARKER & CO., Limited, Kensington, write to us as follows:—"We have pleasure in stating that the work done by you is entirely to our satisfaction, so much so that we shall have pleasure in becoming your customers whenever opportunity offers. by hot water and illuminated by electric light. The front and portion of back elevations will have iron windows, each about 9 feet in width and of varying heights. Large areas will be provided to front of building covered with Hayward's prismatic lights. In the front elevation stone and brick enrichments, ornamental wood and ironwork, &c., will be introduced. The architect is Mr. John Statham Davis, of Cobden Buildings, Corporation Street, and the contractor Mr. William Hopkins, of Thorpe Street, both of Birmingham.

VARIETIES.

A FREE library for young women is being erected in connection with Filey parish church.

MELLOR CHURCH, near Blackburn, which has been for some time undergoing renovation and refitting, is to be reopened on the 23rd inst.

THE city surveyor of Liverpool, Mr. Shelmerdine, is suffering from typhoid fever, but happily it is of a mild form and not such as to cause serious anxiety.

A SUNDAY school and parish room in connection with St. Godwald's, Finstall, were opened on Wednesday. The cost of the new building is about 400*l*.

THE new system of sewerage at Sidmouth was opened on the 8th inst. The plan adopted was prepared by Mr. James Mansergh, and under it all the lower parts of the town hall have been resewered.

AN old thatched Baptist chapel at Purley, Hants, which was renovated a few years ago at a cost of 200*l*., was burned down on the 10th inst., together with two cottages.

THE Archbishop of York consecrated recently St. Peter's Church, Bentley, which was erected at the sole cost of the late Mr. C. E. S. Cooke, of St. Catherine's, Doncaster, and cost about 10,000*l*.

THE turf roof of a cottage at Coleford, Gloucestershire, inhabited by Mr. and Mrs. Hughes and their family of four children, fell in on Wednesday morning, burying all the inmates beneath it. Assistance was speedily rendered, but Hughes and his baby were dead when extricated from the ruins.

THE subscription list for the erection of a monument to Raphael at Urbino is rapidly increasing in length, the Pope, the German Emperor, the King of Saxony, Prince Corsini and

the municipalities of Vienna and Florence being among the principal contributors up to the present time.

A SCAFFOLD which had been erected on the ruins of Ayr Town Hall gave way on Monday while nine men were upon it. Three men managed to save themselves, but three others fell a distance of 70 feet and were killed. The remaining three were seriously injured, and one of them is not expected to recover.

WHILE a number of masons were engaged in giving the finishing touches to a dwelling-house in course of erection at Aberdeen a gable fell inwards and all the men were thrown to the ground. One was killed on the spot, another died during the evening, and four others were removed to the infirmary.

THE Lord Mayor of Birmingham (Councillor Beale) has received a communication from the Sanitary Institute inquiring whether the Corporation will invite the Institute to hold its annual congress in Birmingham next September. His lordship will bring the matter before the City Council at the next meeting. At a meeting of the health committee it was decided, in the event of the Institute visiting Birmingham next year, to do everything possible to make the congress successful.

THE new Eye, Ear and Throat Hospital, which has been erected on the Western Road, Cork, at a cost of over 8,000*l*., was formally opened by the mayor. This hospital is the outcome of the great *fête* known as Donnybrook Fair, which was promoted some seasons ago in the city by Lady Arnott, and through the agency of which a fund was raised sufficiently large to build this fine addition to the hospitals of Cork.

IN consequence of the floods an alarming accident occurred at Mirfield, near Dewsbury, early last Friday morning. An old mill on the Calder, recently used as a machine factory, collapsed, and a number of valuable machines fell into the river which runs beneath it, and which was at the time flooded by the recent rains. The flood also washed away the weir which belongs to the navigation company. The building is the property of Mrs. Wooler and is occupied by Mr. Frederick Smith, of Mirfield. The damage is considerable.

THE Ecclesiastical Commissioners have sold Addington Park, which has been for about eighty years the country seat of the Archbishops of Canterbury, to Mr. English, of Chislehurst, and the price is said to be 75,000*l*. The park at Addington is extensive, undulating and beautifully wooded. At one part of the domain the scenery reminds one of Perthshire, as Arch-

bishop Tait often remarked. Five archbishops are buried in the churchyard at Addington—Manners-Sutton, Howley, Sumner, Longley and Tait.

WROTTESLEY HALL, the ancestral seat of the Wrotesley family for two centuries, has been destroyed by fire. The flames were first discovered in his lordship's dressing-room shortly after midnight on Wednesday, and before available help could be obtained the entire west front was in flames. Lord Dartmouth's private engine from Patshull arrived about two o'clock, but was unable to check the progress of the flames, and the entire mansion was completely gutted, and its valuable contents of furniture, family heirlooms, pictures, and an extensive library of books were almost wholly destroyed.

At the monthly meeting of the Leeds Sanitary Aid Society, held on the 9th inst. in the Town Hall, evidence was produced showing the very serious nature of the present epidemic of scarlet fever in the city, and it was proposed to form a sub-committee for the purpose of urging upon the Corporation the necessity of providing additional accommodation for infectious diseases. It was pointed out that the present accommodation was 185 beds, whereas the recommendation of the Local Government Board is that $1\frac{1}{2}$ beds per 1,000 should be the accommodation provided. Thus Leeds, with a population of 400,000, should have hospital accommodation for 532 cases, or nearly three times what there is at present.

A DISCOVERY of great interest to archæologists has been made at Tasburgh in Norfolk. The village is the reputed site of a Roman camp, and occasional remains have been disinterred there. The new discovery is the burial-place of the victims of what was evidently a considerable battle. In one small pit only a few yards square forty skulls were found, as if the dead had been thrown in in heaps; and at other points in the neighbourhood excavations following on the first discovery have revealed others. The place was evidently a veritable ancient Golgotha. Mr. Walter Rye, the well-known East Anglian archæologist, has gone down to take charge of the excavations still in progress.

A NEW wing for the Church of Scotland Deaconess (Lady Grisell Baillie) Memorial Hospital, 142 Pleasance, Edinburgh, was opened on Tuesday afternoon. The extension is really the completion of the original plan, and the front therefore shows a three-storey building with attics, designed after the domestic Gothic style of architecture. On the ground floor are a

parlour, dining-room and lady superintendent's room; and on the first floor two private wards, giving together accommodation for three beds; while the remainder of the building is devoted to the provision of bedrooms, a surgical-room and ward kitchen. At the back, on the second floor, is a balcony, intended for the patients airing themselves. An extensive court and garden, to the south and east of the extension, provide accommodation to convalescents and others for outdoor exercise, and of this court advantage has been taken by the architects, Messrs. Hardy & Wight, 74 George Street, to add a drying-room and other accessories of a laundry to the original structure. The new building, including furnishings, has cost about 3,000*l*.

BARCALDINE CASTLE, the ancient seat of the Campbells of Barcaldine, is at present being restored by Sir Duncan Campbell of Barcaldine, Baronet, secretary of the Most Ancient and Most Noble Order of the Thistle. This castle, which is a fine example of feudal times, was built in the latter part of the sixteenth century by Sir Duncan Campbell, seventh of Glenorony (Donnochadh dubh), the common ancestor of the Marquis of Breadalbane and the Campbells of Barcaldine, who is said to have built, or at least to have been the possessor of seven castles, and is therefore distinguished by the cognomen of "Duncan of the seven castles" (Donnachadh nan seachd saisteil). Unlike the other castles in the country, which are built on rocks on the margin of our seas or inland lakes, Barcaldine Castle stands on a rising ground a short distance from the sea, on the neck of land which divides Loch Oreran from the bay of Ardmucknish, and close by the road which leads from Shian Ferry to Connell. The family removed from the castle after the '45, and the castle was in consequence allowed to fall into decay. The castle has been roofless for many years, but it is now being restored exactly on the original plan. The roof is now finished and further restoration is contemplated.

AN ancient urn has been picked up from a sandy knoll on the farm of West Skichen, Carmyllie, near Arbroath. It was lying near a dyke and was just protruding from the ground. The urn is of earthenware, hardly larger than a breakfast cup, neatly formed and quite entire. It was forwarded to Dr. Joseph Anderson, of the National Museum of Antiquities, Edinburgh, along with a request that he would give his opinion about it. Dr. Anderson has replied:—"It is a sepulchral urn and of great interest from its being the smallest of its shape that I have yet seen. It belongs to the Bronze Age—that is, the archæological period which preceded the Iron Age and began

after the use of stone tools had died out, and lasted in Britain till within a few centuries of the Christian era. The cup, therefore, is at least a century or two older than the Christian era—say, 2,000 years or thereby. It was probably placed with a burial; and if the place where it was found were searched, the bones would probably be found, and perhaps another urn or more, for where there is one burial of this kind there are often others. In fact, the finding of an urn often shows the site of a tribal cemetery. The little urn is such a fine and perfect specimen that we are anxious to preserve it in the Museum, where all similar sepulchral finds throughout Scotland are well represented."

THE borough engineer (Mr. Charles Brownridge) of Birkenhead has submitted the following report to the ferry committee of the Corporation in regard to the new pier, bridge and stage proposed to be erected at Rock Ferry:—The proposed pier is to be constructed on the northerly side of the existing stone slip, immediately adjoining it at the shore end, and being about 26 feet 6 inches from it at the outer or river end. The pier for a length of about 27 feet at the shore end is proposed to be constructed solid of masonry and concrete, and then continued in iron supported on cast columns for a distance of 791 feet 6 inches from the river wall. It is provided with a shelter 16 feet long in the middle, and a further shelter at the end, or bridge-head, 16 feet long. The floor is of redwood 52.5 feet above ordnance datum, and there is a rail barrier down the centre dividing the pier into two widths. The bridge is 160 feet long and 10 feet 6 inches wide. It is hinged to the pier at its upper end, and at the lower end rests directly on the stage and has an elm floor. The stage is 150 feet long and 32 feet wide, carried on ten floating pontoons, of which the two end ones are made V-shaped to act as cutwaters, and the four centre ones are lengthened under the bridge so as to give additional buoyancy and steadiness. It is proposed to moor the stage in such a position that at low water the outer face will not be less than 50 feet from the end of the old slip, by two breast moorings, each 40 fathoms, two end moorings, each 70 fathoms, and two river face moorings, each 50 fathoms long. The deck is of teak, and the stage is provided with signal light, bell, bollards, water and other fittings, and has stagemen's rooms, stores, waiting-room, with w.c.'s and urinals. It is not proposed to do any work to the pay-office and buildings at the entrance at present, but the committee are no doubt aware that at times of exceptional high tides the existing paving at the entrance is subject to flooding.

The walls of the short length of solid pier are arranged, therefore, in such manner that the level of the entrance buildings may be altered at any future time with very little disturbance or interference. The estimated cost of the works is the same as that included in the Parliamentary estimate, viz. 15,000*l*.

TRADE NOTES.

THE Autocopyist Company, late of 72 London Wall, have removed to 64 Queen Victoria Street, E.C.

THE Waterford District Asylum, Waterford, is being warmed and ventilated by means of Shorland's patent Manchester grates and Shorland's patent concealed extract ventilators.

A USEFUL variant of the "push-and-pull" principle applied to doorhandles is the "Combined" turn, push or pull lock, the invention of Mr. Tom Jones, of Wolverhampton, and placed on the market by Mr. James Gibbons, St. John's Works, in that town, and of Southampton Row, London, W.C. As applied to ordinary room or office doors the old "push and pull" was very convenient, in the respect that it could be opened by anyone having their hands otherwise engaged. It has not, however, been generally adopted, chiefly owing to the public being unacquainted with method of opening and being accustomed to open by turning the handle. The new lock combines the above advantages with the addition of a turn, so that those knowing that it will open by a push or pull on the knob can use it in that way, while those unacquainted with that method will turn the knob and open it in the usual manner. Another advantage of the "Combined" lock is that it requires no special fixing and cutting away of the door to allow the spindle, &c., to pass, it being contained in a special mortise lock case, which allows of strong fixing for the roses of furniture. Mr. Gibbons is also showing the "Tom Jones" improved patent automatic panic fittings, door handles especially adapted for schools, and some novelties in fanlight openers.

ELECTRIC NOTES.

AT a meeting of the lighting committee of the Liverpool City Council, held on the 10th inst. under the presidency of Mr. C. Petrie, there were submitted the electric estimates for the year 1898, which on capital account amounted to 136,987*l*., made up of the following items:—Land and buildings, 25,700*l*.; plant, 27,660*l*.; mains and reinstatement of roads, 51,000*l*.; and the amount required for work done and goods delivered but not

paid for. On revenue account the estimate was 46,080/., the chief items being goods and wages in the supply department 14,000/., and fitting department 20,000/.. The total on capital and revenue accounts was 183,067/.. It is estimated that the receipts of the supply and fitting departments will exceed the expenditure, and will also provide for charges on capital account, consequently no provision will be required in the estimates for the general rate. The estimated cost of the street lighting for next year is (including gas and electricity), 49,946/.; this amount includes 37,939/.. for the old city and 6,916/.. for the added areas.

A CONFERENCE took place on the 9th inst. between the electricity committee of Glasgow Corporation and a deputation representing the burgh of Partick, who are joining in opposition to the application made by the Kelvinside electricity committee for a provisional order entitling them to light an area in which Partick is included. It is understood that an arrangement was agreed to regarding the opposition to be offered to the application.

THE Bo'ness Harbour Commissioners have lately been considering as to having Bo'ness harbour and docks lighted with the electric light, and at their last meeting it was remitted to the engineers, Messrs. Thomas Meek & Son, Edinburgh, along with Mr. Carlow, North British Railway director, and a member of the board, to consider as to having the proposal carried out. The engineers have now purchased the two engines, dynamos and other electrical plant which was recently in use at the Free Library, Edinburgh, for the purpose of lighting Bo'ness docks. The plant, which is as good as new, was purchased at a low figure, and will be forwarded to Bo'ness next week. Offers for fitting up an installation of the electric light at the docks are now being considered, and the work, it is expected, will be proceeded with at once.

ON the 9th inst. Mr. A. Mayor gave an interesting account of the recent applications of electrical engineering before the Glasgow University Engineering Society, the chair being occupied by the president, Mr. H. C. Sadler. The lecturer, after remarking on the great developments made within the last few years, proceeded to describe the application of electricity to street cars, railways and conveyances generally, contrasting their advantages and disadvantages with those worked by steam power. A large number of excellent slides were also shown illustrating the application of electricity to cranes and to boring, planing and other special tools. Mr.

Mayor also showed slides of the workshops of Messrs. Mayor & Coulson, which were specially designed to be worked by electrical tools. In the discussion which followed, Mr. Rowan exhibited some slides of special tools for boring and riveting, the tool being held up to its work by means of electro-magnets. The thanks of the meeting were accorded to Mr. Mayor for his very instructive address.

THE Secretary of State for Foreign Affairs has received a despatch from Her Majesty's consul at Bilbao, reporting that the provisional board appointed in connection with the electric tramway which it is proposed to lay from Zumarraga to Zumaya, in the province of Guipuzcoa, invite plans and tenders, to be received by February 28, for the construction and equipment of the line. Further particulars of the conditions of the tenders for the above-named tram line and branch, which together measures thirty miles, may be inspected at the Commercial Department of the Foreign Office any day between the hours of 11 and 6.

A SERIES of extensive improvements were recently carried out at Strathallan Castle, Perthshire, by Mr. Grame A. White-law, ex-M.P., who some time ago obtained a lease of twenty years of the castle and shootings from the agents of Viscount Strathallan. Besides extensive alterations and renovations in the interior of the castle, a good many improvements were made externally upon the buildings, and also upon the offices, &c., adjoining. Amongst these the introduction of the electric light may be considered as the most important, and Strathallan Castle is now one of the very few mansions in the county where the new illuminant is used. The motive power for generating the electric current is obtained from the river Machany. The course which supplies the existing meal mill is utilised, and by taking from an extension of the present mill-pond a pipe to the old scutching mill on the banks of the river a head of some 20 feet is obtained. The old water-wheel has been removed, and in its place a turbine giving some 10 to 12 horse-power has been substituted, which drives the dynamo. The electric current is conveyed to the castle by means of overhead wires on poles, the distance being some three-quarters of a mile. In an outbuilding close to the castle an electric accumulator, or storage battery, is provided, which is capable of lighting 150 lamps for nine or ten hours. This is charged during the daytime, and supplies current for lighting the castle when the turbine and dynamo have stopped running. The whole of the work, including the water-power, has been carried out by a Glasgow firm.

CALENDARS FOR "'98."

AMONG the many calendars which we have received we may mention as worthy of note that of Messrs. Aspinall. It is of the "tear-off" description, and is surrounded by an ingeniously and artistically arranged colour card showing the various and numerous tints in which they produce their now well-known "Wapitici;" and that of Messrs. Jere Kaye & Co., of Huddersfield, which is also of the "tear-off" variety, but has the advantage of marginal spaces against each date for notes or engagements.

SLAG WOOL AS A FIREPROOF BUILDING MATERIAL.

FULLY alive to the interest in the employment of fireproof materials in building which has been excited by the recent fire in the City, Messrs. McNeill & Co., of Bunhill Row, E.C., and Kirkintilloch, near Glasgow, are issuing an interesting and instructive little book on "The Uses of their Slag Wool in Building Construction for Fireproofing, Sound Deadening, and the Insulation of Heat or Cold." Slag wool, as is now pretty generally known, is essentially a pure mineral glass-like fibre, manufactured from iron slag. It is made by converting this while in a melted condition into fibres by means of a blast of steam or air. It consists of a mass of very fine fibres, varying somewhat in thickness, interlacing and crossing each other in every direction, thus forming an innumerable number of air cells. Slag wool partakes of the nature of glass without its brittleness, the fibres being soft and pliant though inelastic. One of its most important qualities is its unequalled power to prevent radiation of heat or transmission of hot or cold air, which renders it equally valuable as a frost-proofing material or for keeping hot air out of a refrigerator or cold chamber. Being perfectly non-combustible and practically indestructible by heat, as a protection against fire it may be of inestimable value if rightly applied, while its inelasticity and want of solidity prevent the transmission of sound through it, and the material is coming more and more into use as a deadener of sound in the floors and walls of buildings.

As sound is communicated by the actual contact of beams, and especially by the vibration of air between them, it can be well understood how a porous material like slag wool will have a muffling influence on the solid parts of the building, and so occupy the space that sound-wave motion will not be possible.

ALHAMBRA THEATRE.

THE capital programme set before the patrons of this popular resort by its indefatigable manager, Mr. A. Moul, is proving so attractive that the production of the new ballet which it was intended to put in the bills for Christmas is, for the present, found unnecessary, and it may well be so, since the fare provided comprises the two bright and sparkling ballets, "Donnybrook" and "The Gathering of the Clans," the clever sketch "When two hearts are won," by Mr. and Mrs. Sidney Drew; Cissy Loftus, who has added one or two new impersonations to her already extensive repertoire; the cinematographic views of the Jubilee procession, of which, however, we may perhaps be excused for feeling a little tired now; the American trick cyclists, Madeline Kilpatrick and W. H. Barber, and many other turns, all of which are admirable of their kind.

MUNGO NASMYTH.

AROUND the name of Mungo Nasmyth, a famous Glasgow architect, who flourished in the middle of the last century, says the *People's Journal*, quite a number of legends and traditions are clustered. It cannot be disputed, however, that he was an original genius, self-taught, yet with so much individuality that he could hold his own with the most pedantic architects of his time. The history of his life has never been fully recorded, and possibly that is the reason why so many dubious stories have

been circulated regarding him. His name first appears in the annals of Glasgow in connection with the erection of the Town Hall, adjoining the old Tolbooth at the corner of High Street and Trongate, better known as "the Tontine," because the entrance to the Tontine Hotel was afterwards at this spot. There was an open piazza with a succession of arches facing the Trongate, and the keystone of every arch had a grotesque mask carved upon it, the whole series giving a wonderful variety of expression. These masks were familiarly known in Glasgow as "The Tontine Faces," and were for many years a source of wonder to country visitors. It is said that Mungo Nasmyth, then a foreman mason, carved these keystones with his own hands. About thirty years ago, when the piazza was absorbed into the drapery establishment of Messrs. Moore, Taggart & Co., the Tontine faces were removed, and were rebuilt into part of the building then erected by Messrs. Arthur & Fraser (now Fraser, Sons & Co.), drapers, at the corner of Argyle Street and Buchanan Street. Several buildings put up long after Mungo Nasmyth's day were decorated with imitations of these queer faces. When Kirkman Finlay, M.P. for Glasgow in 1812, erected his magnificent mansion of Toward Castle, near Inellan, he caused copies of the Tontine faces to be made and utilised in the building. While it is not improbable that Mungo Nasmyth carved the original Tontine masks, it is doubtful that he then occupied the humble position of a foreman operative mason. The likelihood is that he was the actual designer as well as the builder of the Town Hall. It is difficult to believe that a mere working mason would have been entrusted in 1739 with the heavy responsibility of designing and erecting St. Andrew's parish church in Glasgow. In many ways this is a very remarkable structure. It stands in St. Andrew Square, off Saltmarket, and when it was erected that quarter contained the city mansions of some of the wealthiest citizens. The church itself is almost an exact copy of St. Martin's-in-the-Fields, beside Trafalgar Square, London, which was built in 1726 by the famous Gibbs, on the site of an earlier structure. Two peculiarities are noticeable in St. Andrew's Church. The western façade has a series of pillars supporting a pediment. In ancient architecture it was usual to have one large stone reaching from the middle of the entablature of one pillar to the corresponding centre of the adjoining pillar, thus providing a stable support for the horizontal stone. But in St. Andrew's Church the horizontal course consisted of a number of stones between the pillars, not arched and keyed as in Roman or Norman semi-

circular arches, but showing vertical joints in the masonry between the pillars, without any apparent intermediate support. This was regarded as a great wonder, and Mungo Nasmyth was credited with the invention of a new architectural device. It is no disparagement to his originality to say that he had been anticipated many years before. In the drawing-room at Glamis Castle there is a wide fireplace, which may have been erected about 1480-1520, in which the same device is visible. The horizontal course of masonry has no pillar support in the centre, but stretches across from jamb to jamb, and supports a heavy superstructure. The method of construction is easily understood after a close examination. The adjoining horizontal stones were made with a wedge-shaped tenon-and-mortise on the same principle as an iron bedstead is made, the side-rails of which fit into an inward-sloping mortise. It was thus impossible for a stone to slip through the mortises on each side, and the superincumbent weight only served to make the grip of these stones more secure. This was the method which Mungo Nasmyth adopted in St. Andrew's Church, Glasgow, and had he built this structure in the Middle Ages he might have survived in legends as a potent necromancer. Yet the plan he worked on was a very simple one. In buildings of the Queen Anne period it was quite usual to make horizontal architraves of windows with wedge-shaped keystones, the stones to the right of the centre sloping obliquely to that side, while those on the left were sloped in the opposite direction. The keystone was simply a wedge or inverted pyramid, and it kept the other stones in position by lateral pressure. All that Mungo Nasmyth did was to keep the external joints of his masonry vertical, while the stones were joined together and kept in position by the wedge-shaped tenons in the thickness of the stone. A more remarkable feature in the architecture of St. Andrew's parish church, Glasgow, is the tower with belfry, which rises from the centre of the roof, not from the ground at the west end, as is usual in church architecture. This was a great marvel at the time of its erection, though there is really no mystery about it. The interior of the church has an arcade on each side, running from west to east, supported on strong columns, corresponding in some respects to the cloistered aisles in a Mediaeval church. The weight of the tower is divided between these arcades and the vaulted roof, and it is quite as stable as the central tower of a cruciform church, which was always erected at the junction of the nave and choir with the two transepts. An old Glasgow tradition declares that the masons engaged upon the build-

ing of St. Andrew's Church were convinced that the flat arches and the tower would all fall into ruins whenever the scaffolding was taken down. It is said that Mungo Nasmyth was so confident in the stability of the tower that he stood beneath it with folded arms while the last pieces of scaffolding were being removed. His foresight has been triumphantly vindicated. The church was founded in 1739, but was not ready for occupation till 1761, principally, it is believed, because the Town Council could not raise funds to complete the structure earlier. The actual cost of the church has never been ascertained, but it is certain that between 30,000*l.* and 40,000*l.* were expended upon it, and the Town Council had to sell ground in the neighbourhood of the city that would now be of immense value for the purpose of paying for a church that is left deserted by the wealthy citizens, and serves to decorate incongruously one of the most squalid parts of the city.

CRIPPLEGATE IMPROVEMENT.

A DEPUTATION of owners, occupiers and ratepayers of Cripplegate Ward, headed by Mr. M'Bryde, waited on the City Commission of Sewers in reference to the fire, in which, they stated, most of them had been great losers, while their businesses were practically paralysed by the calamity. They submitted for the consideration of the Commission various matters. The locality of the fire had become a notorious and dreaded one, owing to the occurrence of several previous fires, occasioning far heavier burdens on the petitioners, in the shape of losses and extremely high insurance rates, than upon other citizens generally. There seemed to be a general consensus of opinion that an effort should now be made to prevent, if possible, a repetition of such calamitous disturbances, and that the way to effect it was to open up the locality, by means of street improvements, so as to render the area less densely occupied by buildings, and to give readier access to the numerous and important warehouses in the narrow streets and alleys which abound in the vicinity. Several suggestions had been made and illustrated in the *City Press* for accomplishing that very desirable object, but, being aware of the great experience and knowledge in regard to City improvements possessed by the Commission and their officers, the petitioners thought it unnecessary to come prepared with any definite scheme of improvement, but it might be mentioned that many

of them had regarded with strong approval a proposal made by Mr. H. H. Bridgman, a late member and past chairman of the Commission, to construct a new wide street from the corner of St. Giles's Church, diagonally through the scene of the fire to Aldersgate Street Station, viz. by the intersection of Aldersgate Street, Barbican and Goswell Road, and Long Lane. Beyond being an important local improvement, which the petitioners considered would accomplish the object sought, it would also be the completion of a direct line of thoroughfare from the Tower and the East End to the markets and Holborn, *via* Fore Street, London Wall, Camomile Street, Duke Street and the Minories. It was apparent, moreover, to all taking an interest in such matters that if any material relief was to be secured for the constantly increasing traffic at the Mansion House and adjacent streets—going East to West through the City—the only feasible remedy was the completion of that new main thoroughfare. When such connecting link across the scene of the fire was constructed, it might fitly be regarded as an important metropolitan improvement, and would fully justify the London County Council in contributing towards the cost. The Commission would appreciate the necessity in the public interest of arriving at a decision at as early a date as possible in order to prevent the likelihood of the buildings being again rebuilt on the old lines, thus rendering it impossible to effect any valuable improvement. The petitioners would gladly afford to the Court all the assistance in their power with regard to the carrying out of any improvement that might be decided upon. The memorial was signed by some eighty or ninety firms, some of whom carried on business in Wood Street, but the majority were those whose premises had been destroyed. In some cases, it was said, the occupiers of premises burned out had not been traced, as having resumed business elsewhere. Mr. M'Bryde, replying to questions, said no improvement would be complete which did not deal with the half-circle of Jewin Crescent. There the houses ran back to back, and a fire would run right through them in no time. In the present instance, had there been a strong wind, the fire would not have been stopped until it had reached the General Post Office. Round Fore Street and Jewin Street the street traffic was especially congested, owing to the existence of a great parcels' delivery establishment. He believed the neighbouring occupiers would be prepared to subscribe towards the cost of the improvement. He did not know what the Goldsmiths' Company, who were the ground landlords, were prepared to do, but they had

signed the memorial, and he had no doubt they would behave handsomely. The Chairman said he happened to know that the matter was under the consideration of the company. Mr. M'Bryde, replying to Sir Albert Altman, said enormous rates had latterly been charged by the insurance companies, and if the buildings were rebuilt on the old lines it would be impossible to insure at all, or, if it were, people would simply be working for the insurance companies. A good deal of property—especially of stock—was uninsured in the late fire and since then, when reinsurances had to be made by surrounding occupiers, the rates had been considerably augmented. On the motion of Mr. Tranter, the memorial was referred to the finance and improvement committee for consideration and report, the Chairman assuring the deputation that it should have every attention. At the instance of Mr. John Harris, the streets committee were requested to consider and report as to the advisability of erecting near the fire hydrants receptacles to contain a quantity of hose, with the key of the hydrant, so that it might be available for use on the first outbreak of fire. On the motion of Mr. A. A. Wood, the whole question of the prevention of danger and damage from fire in the City was referred to the same committee.

LONDON COUNTY COUNCIL WORKS DEPARTMENT.

THE finance committee of the London County Council submitted on Tuesday a statement of the cost of the works executed by the Works Department during the half-year ended September 30 last. There are in all seventeen estimated works, which have been completed during the half-year and are now reported upon. The final estimate for these works was 171,049*l.*, whilst the actual cost has been 192,410*l.*, showing a balance of cost above estimate of 21,361*l.* An analysis of the return shows that the losses have been chiefly made on five works. The work of putting in the foundations at Bexley Heath Asylum was entrusted to the department in March 1896, on an original estimate of 31,833*l.* Certain deductions were made, leaving the final estimate at 31,306*l.* The work has, however, actually cost 39,230*l.*, showing a difference of no less than 7,924*l.* between the final estimate and actual cost. The architect reports that 31,306*l.* is the actual value of the work done. The next most serious loss is shown in the work done for the

main drainage committee on the Fulham and Hammersmith sewer. The final estimate for this work was 24,368*l.*, whilst the actual cost has amounted to 31,014*l.*, showing a discrepancy between cost and estimate of 6,646*l.* The erection of the piers and dolphins for the Vauxhall temporary bridge has resulted in a loss of 2,267*l.*, the final estimate for the work being 11,265*l.* and the actual cost 13,532*l.* In the construction for the fire brigade committee of the Whitefriars fire-station the department has exceeded the final estimate of 20,591*l.* by 1,936*l.*; the actual cost having been 22,527*l.* On works carried out at the central dépôt at Belvedere Road, which were estimated to cost 19,210*l.*, the estimate has been exceeded by 1,920*l.* There are five other works reported upon where the estimates have been exceeded, and, on the other hand, there is a balance of cost below estimate on seven works. The finance committee, reporting with reference to the five which show the largest excess of cost over final estimate, state that, at any rate for some portion of the time during which these works were in course of execution, the Works Department was undergoing investigation, which was followed by considerable changes in the staff, and that the manager, Mr. Adams, was not responsible for the works, as they were practically completed before his appointment on February 2 last.

The schedule value of the jobbing works carried out during the half-year was 6,270*l.*, whilst the actual cost was 5,502*l.*, showing a balance of cost below schedule value of 768*l.* The committee append to their report a statement showing the totals of the actual cost and of the final estimates or the amount of the schedule value of all works executed by the Works Department since its creation. From this it appears that the final estimate for all the estimated works completed up to March 31, 1897, was 459,772*l.*, and the actual cost 462,897*l.* Adding to that the figures for the half-year ended September 30 last, of final estimate 171,049*l.* and actual cost 192,410*l.*, it will be seen that the final estimate for all the estimated work carried out by the department has been 630,821*l.* and the actual cost 655,307*l.*, so that the operations of the department since its creation in regard to this class of work have resulted in a loss of 24,485*l.* As to the total of the jobbing works figures are only given from April 1895, since prior to that date there was no schedule of prices for comparison. The actual cost of jobbing works executed up to that date was 72,005*l.* The return shows that since April 1895 the schedule value of the jobbing works carried out

THE GREAT FIRE.

If the roofs of some of the house burnt down in the City had been covered with copper instead of zinc (which blazes), or lead (which melts), the fire would have been arrested at these buildings, as the flames could not have escaped through the roof.

Full particulars for covering Roofs with Copper in the best manner will be forwarded on application to

**EWART & SON, 346 - 350 EUSTON ROAD,
LONDON, N.W.**

by the department has been 62,446*l.*, and the actual cost 57,763*l.*, showing 4,683*l.*, or about 7½ per cent. as the amount of cost below schedule value.

The committee have also drawn up statements with regard to the works refused by the Works Department, for which tenders were afterwards received from contractors, and also a return of the architect's estimates and lowest tenders received for works suitable for, but not offered to, the department. These have been circulated to members of the Council.

THE CITY FIRE.

THE following additional technical evidence was given at the inquiry into the causes of the fire in the City on the 19th ult. Mr. E. Woodthorpe, district surveyor of the northern division of the City, said he had been personally acquainted with the district in which the fire occurred for eighteen years. Every building erected there during the time he had held his present position, or that he saw built before he succeeded his father as district surveyor, was put up in accordance with the requirements of the Building Act at the time in force. All the property was erected under the supervision of well-known architects. He attributed the speedy collapse of the buildings to the effects of the intense heat on the brickwork and ironwork. The walls left standing after the fire gave evidence of having been badly shaken by the sudden expansion and contraction of the ironwork. His professional opinion was that the nature of the internal construction and fittings of the warehouses accounted for the rapidity with which the fire spread and for its fierceness. Many of the fittings extended from floor to ceiling; they were practically large wooden pigeon-holes with narrow passages between. In many of the warehouses the staircases were only separated, as was general in this class of building, by wood and glass partitions, and the offices and rooms were similarly divided from one another. Then in several cases the walls, and even the ceilings, were matchlined. As far as he knew there was only one stone staircase in the whole burnt-out area.

The City Solicitor asked if witness heard Mr. Vickery describe stone staircases as a delusion.

Mr. Woodthorpe replied that he did, but he did not agree with him. The buildings destroyed showed that they were not fireproof or fire-resisting in any way. There were many build-

ings in the City with fireproof floors, or what were called such, namely, iron and concrete, with stone staircases. As an instance of such a building he might mention Winchester House. More than thirty fires had occurred there, but they had always been restricted to the actual floor of the outbreak, and, in many cases, had not even spread to the second room. He had never known a large fire in a building constructed in that way. By saying it was possible to construct a fireproof building he meant one in which it was possible to stop a fire from spreading to any large extent. In many of the fireproof buildings to which he referred the ironwork was covered with concrete.

The City Solicitor asked if witness was armed with sufficient authority to prevent the destroyed buildings from being erected as before.

Mr. Woodthorpe replied that in one or two cases the buildings could not be erected exactly as before, but with those exceptions he was not armed with authority to prevent the warehouses from being built again on the same principle. He had no power to insist on the well hole at 15 Well Street being constructed in a different manner, although he considered it a distinct source of danger. Witness added that, within his knowledge, there had been in the district of the fire several narrow escapes from a large loss of life occurring in buildings of the kind recently destroyed. He was strongly of opinion that every man who erected such a building should be compelled to enclose his staircase with a fire-resisting partition, and continue it up to the roof, and from there provide a ready means of escape. To rebuild 28 and 29 Hamsell Street on the fireproof principle to which he had alluded would involve an extra expenditure of about 50 per cent. to the lessees.

A jurymen asked if witness did not think advantage should be taken of the present opportunity to remodel the neighbourhood of the fire.

Mr. Woodthorpe said that no doubt improvements might be introduced in the arrangement of the streets, but, of course, the property, as was all property in the City, was very valuable.

The City Solicitor intimated to the jury that the matter was receiving the most careful consideration of the Commissioners of Sewers at this moment.

Mr. George Vickery, architect, was recalled, and produced plans of the buildings in which the fire broke out, they having been built under his supervision. Referring to Mr. Woodthorpe's observations about the well hole, he said he should

like that gentleman to explain how it was possible to light the centre of a building with a depth of 75 feet, and surrounded by narrow streets, except by a lighting area or well hole.

Mr. J. Wornham Penfold, one of the three members of the tribunal of appeal under the Building Act of 1894, said he was architect to the Goldsmiths' Company, to whom the Cripple-gate estate, on which the fire occurred, belonged. Including streets, it had an area of about 4 acres, or, without them, of nearly 3 acres. Practically the whole of the streets on the estate had been made and improved from time to time by the company, and he put in plans showing the condition of the property in 1690, in 1778, about 1820, and in 1875. Jewin Street was originally made by the company in 1652, and, together with the remainder of the estate, escaped the great fire of 1666. According to the survey of 1690 the street varied in width from 11 feet 6 inches at the Aldersgate Street end to 15 feet 3 inches at Redcross Street end. At the present time the street was 29 feet wide at its narrowest part and 34 feet at the Aldersgate Street end. In 1690 Hamsell Street was 6 feet wide and was then known as Redcross Alley; by 1778 it had become Redcross Square with a width of 16 feet to 20 feet, and in 1875, in conjunction with the Commissioners of Sewers, it was made 25 feet wide. Compared with other streets in the City that was a very good width. It enabled a cart to stand at any warehouse and still leave a passage for another cart. All the streets on the Goldsmiths' Company's estate, where the company owned the property on both sides, were at least 25 feet wide, but immediately they got off the estate they found no such streets, always excepting the main thoroughfares such as Aldersgate Street and London Wall, and he might also except King Street and Queen Street. With these exceptions there were no streets from St. Paul's Churchyard to the Royal Exchange, either north or south of Cheapside, where two carts could pass one another the whole length of the street. That was nearly possible in Old Jewry, but not quite. There were 107 buildings on the company's estate, of which fifty-four had been destroyed, and about twenty-five damaged. The ground-rent of the whole estate was something like 14,000*l.* or 15,000*l.* a year. When a lease was on the point of expiring they generally had somebody looking out for the site. Except in the case of the charity estate, which they were obliged by the Charity Commissioners to advertise, the company never advertised its sites. If they did so, and threw the sites open for competition, the ground-rent obtained for them would be larger.

A juryman, who said he was a freeman of the Goldsmiths' Company, asked if he might take it that the company were liberal landlords?

The witness replied in the affirmative.

Mr. Hembry asked if witness agreed with Mr. Woodthorpe that to erect fireproof buildings in place of those destroyed would cost 50 per cent. more?

Witness replied that all depended on the degree to which the buildings were fireproof. They would never think of building a warehouse in the way Winchester House was built. The cost would be too much, and the rent more than the people would be able to pay. He thought a reasonable suggestion would be that the different storeys should be isolated by concrete floors. If that were done the probability was that in the case of a building becoming ignited by a fire on the adjoining premises the flames would not spread below the top concrete floor. He did not think the lessees would hesitate, in rebuilding the warehouses, to do as much as that. Witness added that later in the day he had an appointment with a committee of the Commissioners of Sewers to consult about any alterations that might be possible in rearranging the streets on the estate.

The City Solicitor said he believed the Commissioners of Sewers were to meet subsequently representatives of the London County Council to discuss similar matters. He thought the jury might rest assured that the subject was being carefully considered with a view to improvements being carried out.

Witness thought he might add that the Goldsmiths' Company would be glad to give every facility to the authorities.

A NOVEL IRISH RAILWAY.*

It is usually the duty of the president of such a society as this is to select for the subject of his address a review of engineering science during the past year, or to deal in a general way with some branch of that science. This evening, however, I purpose giving you a somewhat detailed description of a novel kind of light railway with which I recently became acquainted. There may be two excuses for departing from custom—the one that light railways are much talked of at the present time, the

The FINEST EXAMPLES.

other that of emphasising the remarks I recently made urging our younger members to keep their eyes open and note on paper any novelties they may meet with either in their daily work or in their travels. The opportunity may not arise in every instance to describe a whole railway and its rolling-stock, but the council would welcome any carefully-written paper, however short, describing merely a detail part of some machine.

It was in Ireland where I met with the only railway in the kingdom built on the Lartigne system; the line was constructed in 1888, and runs from Listowel to Ballybunion, a distance of about ten miles. It is usual to speak of the "gauge" of a railway, but this is an exception to that rule, for it has no gauge; it is, in fact, a single-rail line. The relative cost of this and ordinary narrow-gauge lines over the same route and for the same amount of traffic is said to be as follows:—The Lartigne, 1,948*l.* per kilometre; the 24-inch gauge, 2,488*l.*; the 39½-inch gauge, 2,800*l.* It is my intention to describe this curious railway rather than to praise or criticise the design. Still, as the line is of such a novel form, it will, I think, be only right to point out briefly some of the advantages claimed for it by the inventor, the more so as serious proposals have been put forward for making a line on this principle between London and Brighton for conveying express trains at the rate of 150 miles per hour.

The inventor claims great safety, also that the line can be quickly and cheaply laid. As earthwork is reduced to a minimum, it is only necessary to clear away sufficient earth for the sleepers, as the carriages are high enough to pass clear of a good deal of rough ground. Another advantage is that by a slight modification in design or strength the line can be its own bridge, and thus cross brooks without having to build piers or incur any expensive bridge work. In some countries this design of railway might be very advantageous, as floods, snowdrifts or sandstorms must be of extraordinary power if either of them prevented the line being worked. We all know that a few inches of water, snow or sand will seriously interfere with the ordinary railway; indeed, the traffic is occasionally stopped for several hours, even in England. I must express my indebtedness to Mr. Behr, the well-known engineer in London, and to Mr. McCarthy, the company's manager in Ballybunion, for their courtesies in facilitating the preparation of this paper. The photographs which I am able to show you were taken by an amateur, and as they are his first efforts in that science, I must ask you to be so good as to excuse all shortcomings. Mr. Pitcher has been good enough to prepare

them for the lantern, and I will now ask him to begin putting them on the screen.

The first picture gives a view showing the general appearance of the line. The building is the Ballybunion railway station, and you will observe that quite a crowd of people are waiting to leave by the next train. Ballybunion, though a small village, is rather an attractive spot, and large numbers of people visit the place for the sea bathing. I should, of course, tell you that this village is situated in the south-west of Ireland on the Atlantic coast. This single rail line is composed of A shaped trestles, the top rail weighs about 27 lbs. per yard, and is placed one metre, or, say, 3 feet 3 inches above the ground. The legs of the trestle are of angle iron above, about 1½ by 1½ by 3-16ths. At about 2 feet from the top rail is a cross bar, and at each end of this there is a check rail to control the oscillating motion. At the bottom of the trestle is fixed the sleeper of dished steel; this is about 3 feet 3 inches long by 6 inches wide and ½ thick. These trestles are placed 3 feet 3 inches apart, and were intended to be supported entirely by the metal sleepers, but in this case it was found necessary to put a wooden sleeper of larger area under the metal sleeper. I presume the ground proved to be softer than was anticipated. The steepest gradient is 1 in 47, and the sharpest curve is 66 feet. The line follows the formation of the ground and runs within a few feet of the public road. The station buildings present no feature of interest; they are constructed to suit the traffic and without any pretensions to architectural effect. As the line stands some 3 feet or more above the ground, it cannot be crossed on the level in the same way that ordinary railways can be crossed. A proper bridge is erected at the only spot where the public road has to be crossed. There are, however, several occupation crossings and these are provided by drawbridges; our next photo shows the bridge closed to the public. The next shows it in course of being opened. You will observe the mechanism which can be operated from either side, and you can just discern a signal which automatically indicates whether the bridge is open or closed. In this photo you will see the trestles are strengthened at this point to carry the ledge on which the bridge drops. The next photo shows the bridge down, that is to say, closed against the railway, and open to the use of the occupant of the adjoining fields. There are very few signals, as the traffic does not necessitate any elaborate system of interlocking signals.

Next to the permanent way the locomotive, which is "Mallet's," claims our attention. This is a fairly good view

of it, and as the driver stands near, you can form some idea of its proportion. It is in appearance almost like a toy that has lost its wheels, but yet it is one of some interest. The front view shows you that it has two boilers, two fire-boxes and two funnels; the back view that it has two tenders and two tanks; in fact, in every way it is a double-barrelled machine, except the lamp, which is so large that if they had two there would be no room for the engine. The engine and tender empty weigh 7 tons, when loaded they weigh 10 tons 15 cwt. There are two cylinders, 7-inch diameter by 12-inch stroke; the working pressure is 150 lbs. per square inch, in each boiler there are thirty tubes, and on the tender is another two-cylinder engine, but it is never required. The engine wheels are 2 feet in diameter, and of course are placed in line down the centre. At a speed of 12 miles per hour the engine is capable of performing the following work:—

On the level it will draw	240 tons.
Up an incline of 1 in 500	186 "
Up an incline of 1 in 47	37½ "

The latter is the steepest incline on the railway. The consumption of coal is found to be 15 lbs. per mile. The engine is capable of a speed of 25 miles per hour, but the working speed is 15 miles.

The carriages, like the engines, are double. The passengers sit back to back, but there is no communication between the two halves of the carriage, as the intervening space is taken up with the wheels. The carriages are about 6 feet 6 inches high by about 8 feet 6 inches in total width and 18 feet long. Each carriage holds twelve passengers, or twenty-four for the double carriage. My two photos give side views, the second one showing the van which has inside communication with its companion. The third photo shows the goods waggon, which carries five tons, and which you will notice is close down to the ground and is easily loaded; it is 17 feet in length. The next pictures represent the sand waggons, which carry three tons. These are of iron, and have trap doors for releasing the load. Each half of the sand waggon is about 6 feet long by 3 feet wide at the top and 3 feet deep, tapering to nothing towards the bottom.

Now I must return to the passenger stock in order to call your attention to the most extraordinary railway vehicle I have ever seen or heard of. It is nothing less than a travelling staircase, which is placed at about the centre of every train to enable passengers to cross the line. It is quite a distinct vehicle, having its own wheels, buffers, draw-gear and brakes.

It can be shunted about and put in any desired part of the train. This curiosity, like all the rest of the train, is fitted with one of the automatic air brakes. The rolling stock consists of about thirty-three vehicles, including locomotives, carriages, staircases, goods waggons and sand waggons. There are no less than twenty of the latter. It will, no doubt, have occurred to you that a vehicle running on a single rail, however well balanced, must have some check, and my next picture is to show you how this is accomplished. It is an end view of the lower part of one side of the sand waggon. You will observe a piece of mechanism consisting of a broad wheel on a vertical axle and fitted with spiral springs. This wheel or roller as the vehicle oscillates engages with the check rail, which you will remember I alluded to in describing the permanent way. There are four of these rollers to each vehicle. I am sorry not to be able to show you a sketch of the mechanism for carrying the vehicles themselves, as the photograph was a failure. In the case of the passenger stock it consists of two two-wheeled bogies, the wheels of course being in line and fitted with suitable bearing springs. The wheels are 19 inches in diameter. Each carriage therefore, including the carrying gear and the check gear, has eight wheels and sixteen bearings. The photo shows the buffer and drawgear, which you will observe is of the "central" type.

The next pictures show some of the details of the turntable or switch, the principle of which will be explained more fully by means of a diagram. In the second view you will observe the mechanism for fastening the switch in position, this apparatus being interlocked with a signal. Turning now to the diagram of the switch, I wish to point out to you what appears to me a very ingenious method of getting two through roads by means of one turntable. If you have a straight line on your turntable you could only obtain one through road, in order to pass to the other line you must deal with every vehicle separately on the table. The line on the turntable is curved to the extent in some cases of one-fourteenth of its circumference, and the diagram will show that you can obtain two through roads off each line.

I have already alluded to the gear for checking oscillation and keeping the vehicles upright. To your mechanical minds it must already have occurred that a single-line vehicle must be properly balanced in loading, otherwise, without affecting its safety in the least, there would be great resistance by the rollers pressing on the check rails, and therefore greater consumption of fuel. Every care is taken to

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE

PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact it will **Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish. Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION.

balance the load, as is shown by the fact that even I myself was asked to move to the other side of the train, and I am not particularly heavy. By again referring to one of the views of the engine you will see how easy it is to get the vehicles out of balance; even the driver and stoker must balance each other, or else the engine will be lopsided. I must not omit to repeat a tale told in the district which has, I believe, some foundation in fact. Soon after the line was opened a very stout old lady took a return ticket to Ballybunion; she appears to have been the only passenger, and the guard could think of only one way to balance the train. He borrowed a cow and so accomplished the journey without difficulty. The old lady, however, died, and was buried at Ballybunion, so now the guard was perplexed with the problem how to return the cow. Well, he borrowed another cow of about the same weight, and for eight years, report says, he has been daily borrowing one cow in order to return the one lent him the day before.

GERMAN FLATS.

THE Berlin correspondent of the *Daily Telegraph* writes:—If your correspondents on the subject of "Life in a Flat" imagine that they are much worse off in London as compared with foreign capitals, practical experience of continental life would soon cure their disillusion. The annoyances caused by troublesome, inconsiderate and obstreperous neighbours are pretty much alike wherever one lives; and the defects in houses hired from a landlord are, when one thing is taken with another, rather of a relative kind.

Still, as the subject has been mooted, it may be instructive and interesting to give a brief sketch of the measures taken for rendering houses as sound-proof as possible in the German capital, since Berlin may really be taken as the most modern capital in Europe—comparatively few of its houses being over twenty-five years old. Amongst the more important objects subject to police inspection here is the architecture of dwelling-houses. Not only are the plans of builders submitted in order to ascertain whether they conform to the regulations enacted by the building department of the police, but in the course of erection officials of that department are authorised, whether they have any technical knowledge of the subject or not, to enter the premises and have a look round. The huge barrack-like houses built in Berlin, to be let out in flats, have a great many defects of internal construction from an English point of

view, but their sanitary arrangements are infinitely superior to what they were even twenty years ago, and all this is due to the new provisions rigorously carried out by the police.

Build as you will, however, it is not possible to supply houses of a moderate rent, or of a rent suitable to the pockets of ordinary people, and at the same time to make the rooms absolutely sound-proof. The laws of sound are, like all the laws of nature, inexorable; and unless measures are taken to counteract them, sound will extend upwards, downwards or sideways from one dwelling to another. It does not follow that a house is badly built if the rooms are not sound-proof. The thickness of a party-wall in a Berlin house must not be anywhere less than 25 centimetres, and the thickness necessarily increases by 13 centimetres every two storeys downwards. Thus, the wall-thickness between two houses must be half a metre at the top storeys, whilst on the ground floor it is certain to be over a metre. As to the permeation of sound from above or below, the habits and customs of one's neighbours are necessarily the determining factor. Carpets all over a room are not *de rigueur* in a Berlin house, the parquet floors being very rarely wholly covered. Hence people may often be troubled by the stamping and walking of families immediately overhead. Where musical instruments are constantly being used, their position against or near the wall affects the intensity of the sound heard in the other dwellings. It is impossible to prevent one family from using them in order to suit the wishes of another family in the same house, but there exists a rule or custom in all provincial towns, as well as in Berlin, prohibiting music in general after ten o'clock at night.

Unless I am misinformed, the following description expresses approximately the difference between the customs prevailing in the two cities:—In Berlin the beams supporting the floor of a dwelling are 21 centimetres in thickness; in London they are just half. In Berlin the distance between the beams is 90 centimetres, in London it is 60 centimetres. In the Berlin house the upper half of the space between the floor of one room and the ceiling of the room below is filled with ashes, and the ceiling is constructed of a lining of planks upon which the plaster is laid; in the London house this space is empty, and the ceiling is constructed of plaster, simply laid upon laths. Owing to the difference between the two plasters, the procedure adopted in London would be impossible in Berlin. Then, again, the space between a Berlin floor and the ceiling underneath is 33 centimetres, whilst in London it is only 26 centimetres. The Berlin procedure is dearer and

heavier. London houses are erected on land which is not the property of the builder, whilst in Berlin the owner of a house is also the owner of the soil on which it stands, and this is probably the reason why London houses are of a lighter and less expensive nature than Berlin houses. The above figures and remarks are, of course, only to be taken in a general sense. I cannot say whether they are applicable to all cases in London.

Where money is no object, and in edifices which are built with the express intention of avoiding the transmission of sound from one floor to another, special methods can be adopted, and are actually adopted, as in the case of schools for music, Government and official buildings and the private houses of very rich people.

Another kind of ceiling, called Klein's, has recently come into vogue here in certain cases, notably in a new and enormous shop consisting of several storeys just opened by Messrs. Wertheimer, in the Leipziger Strasse. The beams are of iron and the general construction is of another kind; but this is not applicable to private houses.

The arrangement of doors in a Berlin house differs entirely from that in use in London, so that a comparison between the partition walls of the interior need scarcely be made. The transmission of sound between room and room over here depends mainly on the number and size of the doors used. In Berlin a room rarely has less than three doors.

It is to be feared that no builder in any capital can, in the present state of technical knowledge, and in face of the demand for cheap houses, be expected to consider the woes of the nervous and weary when tormented by the screeching and strumming of noisy neighbours, however desirable such thoughtfulness may be.

AMERICAN TENDERING.

THE following communication from Mr. F. R. Comstock, architect, appears in *Architecture and Building*:—

During the past few weeks my attention has been called to the general condition of the building business, and especially the wide difference in the amounts of the highest and lowest bids received in competition for the erection of many of our buildings.

During an interview with a number of contractors it was suggested that the subject be given a little more attention, and

I have endeavoured to find out the why and the wherefore of the present condition among the building trades. It is not expected to solve this entire question in this short letter, but I would suggest that those interested should write to the editors of *Architecture and Building*, giving their reasons for or against the present system of competitive estimates, and perhaps give a suggestion as to how it can be improved. Many contractors have given the main cause for this wide difference in estimates, that the architects do not make complete plans, showing all the minor details in large scale drawings to enable the contractor to estimate intelligibly; that the specifications are not absolutely complete, and that when they estimate they have no opportunity to see what the full-size details are, for the architect has not had time to make them, or will not make them, so that the contractor has to use his best judgment, and in many cases guess at what the finish is to be.

In a certain city in the Middle States the contractors formed an organisation known as a Board of Trade, got up an agreement that hereafter they would not estimate on any building unless the drawings, &c., were all complete as itemised above, and the result has been that the architects in that locality have been compelled to produce more complete plans and better specifications for the erection of buildings, and it was reasonable to suppose that certain portions of this problem were solved, but a few weeks ago the writer had occasion to visit this city during the awarding of a contract for a six-storey fire-proof building, and the local contractor who was awarded the contract signed it without knowing that the amount of the highest competitor was 32,000 dols. more than the lowest estimate; also estimates were opened for a two-family house which included two copper bath tubs, three water-closets, two wash-bowls and kitchen boilers and sinks, gas piping of the house, with connections to the sewer and water, approximately 25 feet from the front of the building, for the sum of 192 dols., and the heating contract, a hot-water system with six radiators on each floor, was given for 325 dols., all remaining bids for heating and plumbing ranging from 50 to 75 per cent. higher, and it was remarked at the time that there was an opportunity for some people to learn more about estimating.

A few weeks ago there was a competition for a public building in Connecticut where the difference between the highest and lowest contractor for doing the work, according to plans and specifications submitted, was a trifle over 30,000 dols. A while ago a contract for a public institution was awarded where the bid was 52,000 dols. less than the highest estimate,

JOSEPH T. SZEK.

AGENTS APPOINTED IN ALL LARGE TOWNS.

the contract approximating 120,000 dols. Seventeen contractors estimated in this case. Within a few months the estimates were opened on a chapel, where there was a difference of 5,000 dols. between three contractors on a 12,000 dols. job. Not only does the public note the difference in the public buildings, but the building public in its domestic work has reached the point where it looks for these great differences in estimates, so as to get the building erected as cheaply as possible, and oftentimes you will hear a client say, "It ought to be built for 6,000 dols., but I will get a large number of estimates, and I will build it probably for 4,000 dols.," and the most remarkable thing in the statement is the fact that he gets it done. Recently the contract for a two-family house was awarded to out-of-town parties for 3,200 dols., where the highest local contractor was 1,500 dols. higher, and last year a friend of the writer obtained drawings and specifications for a single house, and submitted the drawings in competition to five masons and seven carpenters and the usual number of sub-contractors, and the lowest combination was 5,600 dols. and the highest 11,000 dols. A New York gentleman made the statement a few days ago that if he had not obtained a large number of estimates from different contractors he never would have built his house. Many circumstances of like nature, as stated above, could be given, but the foregoing list is sufficient to show the actual difference in many of the competitions. What is the cause of it? What is the reason that two men will take the same set of plans, specifications and details and be 5,000 dols. apart on a small contract? You might ask this question of some contractors, and they would say that it is the difference in the completeness of plans and specifications. One you can drive a horse and cart through, and the other states specifically what kind and quality of material is to be used, yet that same contractor will criticise the architect if he puts everything in his specifications and explains everything carefully, and he says the specifications are too long. Certainly contractors ought to appreciate the fact that the more complete the specification is, the more it tells him what is expected, the longer that specification is going to be. The mere fact that a specification "covers the floors with good quality spruce boards," as some of them are written, is rather vague and more liable to be misunderstood than the clause that calls for "¾ by 5 inch matched, first quality spruce flooring, laid in long lengths," &c.; and again picking up a specification a few days ago, I read under the heading of hardware that "the contractor shall furnish and put on proper hardware for the entire building,"

which is vastly different from giving the number and trade name of the various fixtures, so that each and all can estimate on the same quality of goods. It has been suggested that if two men estimate on certain plans and specifications where the kind and quality of every bit of material is mentioned, sizes given, &c., each go out into market and get their estimates and the prices of the material amount to the same, that it is a question of judgment who will get out of it at the least possible expense. One contractor can take a body of men and handle them to a great deal better advantage than another contractor. One contractor works with his men and only takes the amount of work that he can personally attend to. The other contractor takes a large amount of work which requires expensive foremen, time-keepers, requires a carriage to go around, and some person must pay for his time superintending the work. In this case it is a question of personal expense, one over the other. It stands to reason that the man who works with his men can produce buildings at a lower margin than the man who is compelled to employ superintendents.

One man is satisfied with obtaining day's wages out of a contract with from 2 to 5 per cent. profit on the entire job. The second contractor could not possibly live at this rate. These circumstances must be one reasonable answer to the question.

Some time ago I had occasion to see different detail statements made by various contractors of quantities of material taken off from a given set of drawings. Each took about the required length of time to get the statement from the drawings; all contractors saw the same drawings and specifications, and yet there was a difference of 25 per cent. between the total amounts of material as taken off by these men. The contractor who obtained the contract was asked to keep a record of the number of brick used for that particular job; meanwhile the various amounts taken by the other men had been noted down. When the contract was completed it took 20,000 more brick than the man who had obtained the contract included, and that was approximately 10 per cent. higher than the highest man. From this statement, and from knowledge of the usual system of estimating, it seems, strange to say, that there are very few contractors who can estimate accurately the required amount of material for a building.

In answer to a question put to a contractor some time ago, how he arrived at the number of brick in the building, he replied that he built a building for John Jones last year about the same size and he bought so many brick, and this was something like it and so he supposed it would take about the same number,

and it is not surprising to note that this man lost money on the contract. The guessing at quantities and cost has considerable to do with the wide difference, for, in speaking of the question to a contractor recently, he said:—"One night when I got home there were seven sets of plans at my house for estimates, and as I had been out on the buildings all day and many of the estimates were required to be in by the morning, I sized them up and gave a guess figure on all seven, comparing it with my other work; strange to say I did not get one of them." And in answer to the inquiry, "Would it not have been better to have selected one that you wanted and given that careful and conscientious estimating, so as to make a strong endeavour to get one of the jobs?" he replied that it would have been of no use, for the whole system of competitive estimating to-day was a lottery; the man that can guess the nearest gets the job, and he said:—"Many times I have been influenced by seeing an article in the paper that so-and-so was to build a house to cost so many dollars, and I would look the plans over and give my guess in and sometimes I would hit it."

Against the contractor who cannot take off proper quantities and the guessing man is put the contractor who has made a list of prices to govern his estimate; that is to say, he has got a detailed statement of all the items that go in the building, with a schedule of prices. Once in awhile it is changed, but usually it lasts for six months or a year. No matter what the condition of the market is, our friend always uses his schedule. He has figured a small profit on each item, no matter whether brick cost 6 dols. a thousand or 9 dols. a thousand; he always charges 15 dols. a thousand to lay them; no matter whether the plaster is one, two or three coats, it is always 40 cents, and everything in proportion, and when he gets his estimate all done according to his schedule he will add a percentage for what he does not see and a percentage for profit, and then he will submit his estimate and then he will stand back and grumble with the rest, "The man who got that contract is losing money," and the invariable rule is that the man who grumbles the most and always sends the other fellow to the poor house estimates this way.

Anybody can see that he is getting a profit on a profit, and it is strange to see how many contractors figure this way. He is like the plumber who estimates his goods up at list prices, which I saw done within three months, and then charges a percentage of profit on that, after giving the total of material and labour, and it is not to be wondered at that his price was about three times what the contract was let for. In various

parts of the country the system of estimating is vastly different. In northern and western New York State contractors always get legitimate sub-estimates on a given list from the mill men or material men, &c., on every contract; also in the larger part of the country, outside of Connecticut, all contractors stand on their own department. Everything is let differently. The mason work goes to the mason and the carpenter work to the carpenter, and so on down through the job. Perhaps it is not as convenient as to deal with one man who knows nothing about the other trades outside of his own, and who charges you 5 to 10 per cent. for doing your business, and he making all he can off the sub-contractors, for no man is going to do your work for pleasure; there certainly must be a dollar in it.

In Connecticut the sub-contracts are usually awarded the last thing so as to get the advantage, if possible, of a fall in the market, and it is their practice, in the majority of cases, to wait for a house to be lathed and plastered and cleaned out before the sizes and measurements are taken for the inside trim. Recently we asked a contractor why this was, and he replied that sometimes the market price of material and labour went down, and then they always deferred ordering the material, for perhaps the owner might want to make some changes and he would not want to pay for material twice.

On the other hand, a New York contractor recently said that inside of twenty-four hours from the signing of a contract he had awarded every sub-contract on the job, turned over all the details on the contract and contracted when it was to be done, and then it was off his mind and he had an opportunity to look for other work, for they were to take charge of their own sub-contracts.

That is one of the principal reasons why work can be erected in other States much more rapidly than in Connecticut. I heard recently that a certain mill man would fill orders in say four weeks from local factories with work and material, whereas if eight to ten weeks were allowed him he would furnish the same work and material from his western factories at something like 25 per cent. less. This should be an additional reason for ordering work promptly, but how many contractors take advantage of this? and it is the prime reason why it takes six to nine months to build a 6,000 dols. house in Connecticut against three to five months in New York State. We have seen contractors take estimates both on the cost per square foot of the ground floor and the cubical contents of the building, of course having kept record of their work and experience on other

READING CASES for THE ARCHITECT
Price 2s.—Office: 175 Strand, London, W.

NOW READY,

PROUT'S CONTINENTAL SKETCHES

Proofs on Thick Plate Paper in Handsome Portfolio, Cloth, Gilt
Lettered, Size 21 Inches by 15 Inches, Price 42s.

The work consists of 75 Plates, and was originally published at
30 Guineas. The Plates are the full size of Prout's Drawings
and are an exact reproduction by the

PERMANENT INK PHOTO PROCESS.

Mr. RUSKIN, referring to these Drawings, says:—

"I have," says Mr. Ruskin, "both in my earlier books and in my lectures at Oxford, spoken of the sketches of Prout with reverence and enthusiasm."

"Prout ransacked every corner of France, Germany, the Netherlands and Italy."

"The sharpest photograph is not half so natural."

"His 'On the Grand Canal, Venice,' is an Arabian enchantment, his 'Street in Nuremberg' is a German fairy tale."

"Prout drew every lovely street in Europe."

May be obtained from all Newsagents, Booksellers, Messrs. W. & A. SMITH & SON'S Bookstalls, or from the

PUBLISHER, P. A. GILBERT WOOD

Office of "The Architect," 175 Strand, London, W.C.

buildings, and thoroughly understanding the conditions and perhaps a knowledge of the work of the architect; but what sort of a chance does the conscientious contractor stand against all these contractors when he sits down and laboriously takes off each item, each quantity of material, gets his sub-estimates from the mill, adds the total cost of the material in the building with their quantities in one column, figures out as accurately as possible his labour account, his insurance account, cartage and incidental expenses, and he knows to a certainty that to do that job it must cost him a certain amount of money?

Now comes in the question of his own time, and he figures the amount of personal attention that will be required of him and adds that, then considering his time and the money with its interest and the risk, and what he is satisfied with for a straight profit—and he has a choice of wide margins here—and it is the balancing of this column of profit and loss that sustains the man in business. A few years ago it was the custom and privilege of many of our contractors to ask 10 per cent. for their profit on any contract, but the wide difference between the highest and lowest estimates shows the profits run from 10 per cent. down to 1 per cent., and we have heard where it was totally ignored in the sum and total. This, no doubt, is why the columns of the financial papers give such an extensive list of failures and assignments, and at the bottom of the page note the disappearance of numerous contractors. Contractors have been obliged to estimate on this principle, and why? Because the general public are estimating closer; people who can easily afford to pay a fair living price want to cut it down as low as possible, and whereas they know you can “live and let live” at 10 dols., make day wages at 8 dols. and just exist at 6 dols., will continually crowd you to the 6-dol. point. The result has been that the contractors, to get any work at all, have been obliged to estimate as close as possible and trust to luck and chance or the possibility of skinning the job to get a fair living out of the work. The owner and client employs an architect, not according to his ability or his honesty, but simply from the fact that he works cheap, and when he employs an architect to supervise his house he only does so that he can get a man to stand over the contractor, who has taken the job too cheap, to see that he cannot possibly skin it, and when the contractor fails to live up to the standard of the specifications, which he cannot do for the price, then our owner and client falls on the architect and says he is not doing his duty in not making the contractor live up to his contract. Owners

and clients are many times at fault and the cause of their own dissatisfaction with contractors and their work, and many times for their being cheated. The one point in view seems to be “How much?” and many people of our city are familiar with the incident where an out-of-town contractor bid for work in a city and obtained five or six contracts. He certainly was lower than the local men; who he was and what he could do was not in it; it was not a question to be considered against the price. To be sure he started the buildings and reached the roofs and enclosed them, for about then two payments were due, which were made, and is it to be wondered at that to-day there are a number of people looking for that man? In some cases the houses are completed, usually at the “expense of the owner,” and sometimes at the expense of the material men. You will rarely hear the owner say how he got caught on that deal, but he will always tell you “how cheap he got it.”

Is it the fault of the competitive system? Is it the fault of the general public in not appropriating more money, or is it the inability of the contractor to make a proper estimate? Who can tell?

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

28169. Benjamin Samsome, for “Improved tile for roofing and otherwise covering houses, factories, shops, verandahs and such-like places.”

29151. S. Fawcett, for “Brickmaking machines.”

17. Goodwin, for “Cowl or chimney-pot for preventing down-draught in and rain from descending chimney-flues.”

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from $\frac{1}{4}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{3}{16}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

THE EXPANDED METAL COMPANY, LTD.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

BELPER.—Jan. 8.—The Belper Rural District Council offer premiums of 15 guineas and five guineas for the two best sets of plans and reports for Crich water supply. Mr. Joseph Pym, clerk, Belper.

BELPER.—May 1.—The Belper Urban District Council offer premiums of 50 guineas and 25 guineas for the two best schemes of sewage disposal. Mr. Joseph Pym, Urban District Council Offices, Belper.

BOOTLE.—Dec. 31.—The Corporation invite competitive designs of a central fire station, firemen's dwellings and district police station. Mr. J. A. Crowther, borough engineer, Bootle.

-------------------------------------	------	---	---

THE church of St. Mary, Scawton, which for some months has been closed for restoration and renovation, was reopened last week for public worship by the Archbishop of York. The porch has been entirely rebuilt, also part of the west end, and the original window restored. The outer walls have been carefully repaired where required, and the whole completely repointed. The roofs have been renewed, the heavy stone slates replaced by red tiles, the chancel roof brought to its original pitch, a new bell-cot provided, all dressed stonework stripped of its plaster and whitewash, floors replaced with cement concrete, &c., and the church now has a neat appearance. The work has cost about 600*l*.

THE STEWART ENCLOSED GLOBE ARC LAMP.

WE have had brought to our notice an enclosed arc lamp which has many excellent features, and which is being introduced by the Stewart Electrical Syndicate, 5 New Compton Street, W.C.

This arc lamp works on the same principle as the now well-known Jandus lamp, but there are many features which stamp it as one of the best on the market. The arc is very long, being from $\frac{3}{8}$ to $\frac{1}{2}$ an inch, depending on the voltage, and burns in an enclosed globe of glass. This globe is placed inside the outer ordinary globe, which itself is nearly air-tight. The effect of this is that the oxygen in the inner globe is soon completely consumed, and the arc is maintained in an extremely heated atmosphere of nitrogen and carbon dioxide. There being very little oxygen present, the carbons do not burn rapidly.

The special feature of the Stewart arc lamp is the purity of the carbons, which removes the objection to nearly, if not all, other enclosed arc lamps, viz. the blackening of the bulbs. It has come to our notice that the inner bulbs of these arcs do not blacken perceptibly in the time allowed between the trimming.

The arc lamp mechanism is very simple and effective. Another very important advantage in this lamp is the ease in trimming and the economy in carbon. The lamp will burn for 150 hours with one pair of carbons. The negative carbon is completely consumed, and the portion of the positive carbon which is left is just long enough for, and is used as, the negative for the next run. This means that only 12 inches of carbon are necessary for 150 hours burning. Supposing the cost of carbons for an ordinary arc lamp to be 2*l*. per annum, the cost of carbon will be, say, 3*s*. 6*d*. for the enclosed lamp to do the same work, and if the ordinary lamp burns ten hours without retrimming it will require trimming fifteen times to the enclosed arc lamp's once. The saving in carbon and attendance is thus considerable.

The Stewart arc lamp is the only one which will burn singly on circuits of 150 to 220 volts with economy. It is made in all sizes from 2½ amperes and upwards, and for all circuits from 75 to 220 volts. They are used for public lighting by the St. Pancras Vestry and at the Blackpool Winter Gardens, and they are also used at the Holborn Restaurant, the Frascati Restaurant, and in many shops in London and the Provinces.

BUILDING AND BUILDERS.

A MEMORIAL-STONE was laid on the 15th inst. in connection with the enlargement of the Duke Street Wesleyan church, Castleford.

A NEW Board school is to be erected in Cragg Street, Colne. The site will cost 300*l*.

It is proposed to establish a new Liberal Club in Peterborough, and a site has already been obtained.

IN a recent limited competition the plans submitted by Mr. T. W. Cubbon, architect, of Birkenhead, have been placed first by a professional assessor, for new Unitarian school buildings to be erected in Bessborough Road. The scheme includes a future church and other buildings.

THE memorial-stone of the Chalmers Memorial Free Church, Pollokshaws Road, Glasgow, was laid on the 18th inst. Accommodation will be provided in the church for 840 people. There will also be a hall and classrooms in connection with the church. The contracts amount to about 6,000*l*.

It has been decided to build a mission church in the parish of St. Barnabas, Openshaw. Plans and specifications have been sent to the committee of the Diocesan Church Building Society, with a view of obtaining a grant in aid of the project. The parish of St. Barnabas is one of the poorest and most populous in Manchester. A similar movement has been started in the district of Maeland, Rochdale.

THE foundation-stones of Belgrave Hall, a new Wesleyan place of worship at Leicester, were laid on the 13th inst. The new building is situated in a densely populated district, commodious Wesleyan schools opened last June being already overcrowded. The entire premises, including school and land, will cost about 9,500*l*.

A CONSIDERABLE portion of some new buildings being erected in Westgate, Bradford, opposite, Worsley's furnishing establishment, collapsed on Thursday, the 16th inst. The Castle Hotel is being reconstructed and so far as the principal part of the hotel is concerned had been practically completed. On the Gratton Road side, however, there were being erected a billiard-room, three shops and a number of bedrooms, which had been carried to the ceiling, and it was this portion which, just about two o'clock, collapsed into the cellars, without in any way injuring the adjoining premises. It is generally believed that the foundation, which is said to have been "made ground," gave way.

ARRANGEMENTS have been made for the transfer of the whole of the cliff front from Boscombe to Bournemouth Pier from Sir George Meyrick to a syndicate, with a view to the construction of an undercliff drive and promenade. The cliffs and foreshore are at present held by the Corporation, but their tenancy is terminable at a month's notice. The greater part of the undercliff will, it is conjectured, be utilised for building purposes.

A WELL-ATTENDED meeting for the consideration of the scheme for the proposed enlargement of St. George's Church, Redditch, was held in St. George's Schools on the 17th inst., Colonel V. Milward, M.P., presiding. The chairman spoke warmly in favour of the scheme. It was proposed to add a new aisle, which would be somewhat wider than the existing aisles, the seats being made to hold five persons instead of three. The Rev. Canon Newton expressed his approval of the scheme, which was estimated to cost 500*l*., and proposed a resolution that it be adopted. This was carried unanimously.

THE foundation-stone of St. Kenneth parish church, Govan, has been laid. The new church is situated near the junction of Hutton Drive and Catherine Drive, and overlooks the Elder Public Park. It will be constructed chiefly of brick and white freestone, and the architectural design is after the Early Norman type. The entire cost of the building will be over 4,000*l*. Mr. P. Macgregor Chalmers is the architect.

At the Town Hall, Barnsley, an inquiry was held on Friday last into an application of the Barnsley Town Council to borrow 6,416*l*. for the purchase of a site and the erection of a smallpox hospital. The Kendray Infectious Diseases Hospital, erected in 1886, had a special block for smallpox cases added to it in 1889, taking up about one-third of the whole accommodation. It is being increasingly appreciated, and a larger proportion of cases are being sent to it; 179 cases were treated in 1895 and 293 in 1896, although the number of notifications was less. At present the smallpox block is being used for convalescent scarlet fever cases. Further accommodation is required, and as the Local Government Board will not sanction any loan to hospitals where smallpox is treated with other diseases, the hospital now proposed becomes absolutely necessary. It will be built for fourteen adults, and such an administrative block as will suffice for any future extension of the hospital. Five acres of land at Lund Lane, Monk Bretton, have been bought from Colonel Wombwell's trustees for 1,000*l*.; the remainder of the money is required for the building.

TRADE NOTES.

THE new fever hospital, Llandudno, is being warmed and ventilated by means of Shorland's patent Manchester grates.

A CERTAIN section of property owners in London can view with equanimity the reports appearing from time to time as to the purity or otherwise of the water supplied to London consumers as they draw their water from the chalk by using private wells on their own premises. It can be readily imagined that brewers avail themselves largely of the opportunity of thus securing a pure and abundant supply, and a number of hotel proprietors also figure in the list, the cost per day for water being far below the amount that would be chargeable by a water company. Amongst others the Langham and the Savoy Hotels find the system a distinct advantage, and the huge new building, the Hotel Grand Central, is to be supplied with water from a well now being sunk by Messrs. Merryweather & Sons, who propose to insert a lining of cast-iron cylinders through the London clay to exclude all impure springs, which would otherwise contaminate the pure supply from the chalk.

LOWE'S Patent Pipe Joint Syndicate have a patent which, properly exploited, should prove of the greatest advantage in sanitary work. It consists of a new elastic joint for earthenware pipes, and undoubtedly possesses many advantages over the old system of cement joints. Among these advantages may be mentioned the following:—The rapidity with which joints can be made; that none of the material can possibly get into the inside of pipes; that the joint is a perfect and reliable water-tight joint as soon as completed; that a number of the pipes can be jointed on the surface of ground before laying into trenches. The absence of sockets enables the pipes to be more evenly laid on concrete bed, also enables them to be packed more closely, and

consequently the liability of breakage in transit is very much reduced; the elasticity of the joint and the very small portion of the material composing joint that is exposed to the action of sewer gases; analyst's report as to the durability of jointing material, and its freedom from being affected in any way by the action of sewage or other gases; the ease with which a severance can be made when desired without damaging the pipes. So far round pipes have been employed by the Syndicate, but it is their intention to use ovoid pipes in future. We certainly think well of the Syndicate's specialty, and shall probably refer to it at greater length when space permits.

VARIETIES.

THE new Keighley Building Trades Exchange was formally opened by the mayor, Mr. R. N. Smith, on the 15th inst.

A STONE statue representing St. John has been placed in a niche near the Percy Shrine in Beverley Minster. It is the gift of Canon Nolloth, the vicar.

THE Ferguson Memorial E.U. Congregational church, Springburn, Glasgow, was opened on Saturday last. The church has sitting accommodation for 350.

A NEW Primitive Methodist chapel was opened at the mining village of Goldthorpe, near Mexborough, on the 16th inst. The building will accommodate 400 worshippers, and cost 400*l*.

THE fresco painting of the Nativity discovered recently underground in the Piazza San Pietro, near the right colonnade, is supposed to be part of the decoration of an ancient demolished church which once stood there.

MR. BAKEWELL, architect, at a meeting of the Leeds corporate property committee, stated that the City Square will be thrown open early in February. The statues, however, are not expected to be in their position for a couple of years.

A PICTURE which has been attributed to Rubens has been discovered at the house of a resident at Sandis, near Havre. The canvas is 4½ feet by 3 feet, and the subject of the work is the "Death of Dido." The French Minister of the Fine Arts has sent a representative to examine the picture, with a view of securing it for the State if it be really a genuine Rubens.

THE large and commodious schoolrooms which have been erected in connection with the Cross Street Baptist chapel,

151, 152, 153, 154 & 155 CURTAIN ROAD, LONDON, E.C.

Arnold, were formally opened on the 13th inst. The memorial-stone of these buildings was laid on September 9. The work has been carried out at a cost of about 500*l.*, and provides accommodation for 200 children.

UNDER the auspices of the Birkenhead Corporation Prof. Fred. M. Simpson, professor of architecture at the University College, delivered on the 16th inst. a lecture at the town hall on "Old Architecture in Liverpool." He dealt with the general principles of architecture, and as examples of eighteenth-century houses existing in Liverpool he showed views of Duke Street, Great George Square and Kent Square, which he said was one of the best squares in the city. He also illustrated the ironwork of the period, and said houses in those old days looked at each other with dignity and did not jeer across the street, as did so many modern buildings.

A PLEASANT meeting of the members of the Worcester Diocesan Architectural and Archaeological Society was held at the Guildhall on the 13th inst., when the Very Rev. the Dean occupied the chair. There was exhibited during the evening a collection of historical medals, tokens and curiosities of a very interesting character. The Rev. J. K. Floyer (joint hon. secretary) read a paper of considerable interest on "A recumbent effigy in the cloisters of Worcester Cathedral, said to represent Alexander Neckam (died 1217), and some account of his life and works."

ON Saturday afternoon the mayor of Heywood (Mr. Alderman William Healey) opened the new sewage works which have been constructed at Botany Bay for the Corporation at a cost of about 35,000*l.* The precipitation tanks are six in number, each 75 feet long, 30 feet wide and 8 feet deep, and will in the whole contain 675,000 gallons, or about one day's dry weather flow of sewage. The tanks can be worked upon the quiescent or continuous flow system, and it is proposed to adopt the latter. There are also twelve artificial filters, each 60 feet 9 inches long, 16 feet 4½ inches wide and 6 feet deep, and these cover a surface of 1,325 superficial yards. In addition, five acres of land have been laid out in filtration plots.

BRAMPTON CHURCH has been reopened for public service after having undergone during the past six months, under the supervision of Mr. Taylor Scott, architect, of Carlisle, considerable addition and improvement. The external portion of the fabric has been restored and new sanitary arrangements executed. A large number of internal improvements have been made, the most conspicuous being a handsome moulded and

carved oak pulpit of Gothic design with oak stairs and elaborate balustrade at either side, continued to form the rails at the sides of the Communion-table on the raised floor above the church. The Communion-table is also of beautiful moulded and carved oak-work, as is the minister's seat. The choir-seats have been constructed in front of the pulpit, slightly raised above the congregation. The internal decoration has been carried out in light warm tints to harmonise with the surroundings. New floors have been laid and the seats renovated and varnished, new gas-fittings provided and the lighting greatly improved.

ELECTRIC NOTES.

THE Bournemouth Town Council have finally disposed of the proposals to construct electric tramways. An endeavour was made to appoint a committee to obtain information as to the working of tramways in other boroughs, but by a majority of ten votes to six it was considered not desirable for the Council to construct or allow others to construct tramways in Bournemouth.

At a meeting of the lamp committee of the Leeds Corporation, held on the 16th inst., it was reported that the arrangements for lighting Briggate, Boar Lane and North Street by electricity were almost completed, and that, at the very latest, the streets mentioned would be so lighted on Christmas Day.

THE trustees of the British Museum have decided to discontinue the opening of the exhibition galleries on weekday evenings from 8 to 10 P.M. after the close of this year, and, instead, to keep them open until 6 P.M. all the year round. The evening opening commenced in February 1890 on the installation of the electric light, the galleries, however, being opened only in sections, as the electric plant is not powerful enough to light up the whole building. At first the eastern and the western portions of the Museum were opened on alternate week-day evenings, but the number of visitors so rapidly declined that the galleries were afterwards further subdivided into three sections. The numbers, however, have still continued to decline. The experiment of evening opening having thus had a fair and patient trial, will now be abandoned, and a lengthened exhibition by day will be substituted during the months when the Museum has hitherto been closed at 4 P.M. or 5 P.M., according to the season of the year. On and after Monday, January 3 next, the exhibition galleries will be kept open throughout the year from 10 A.M. to 6 P.M., with this

Telegraphic Address, "PITTURATO, LONDON."

Telephone No. 5975, Avenue.

THE PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact **it will Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish. Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION.

reservation, however, that during the dark hours, when the electric light has to be employed, only half of the Museum (the eastern and western galleries alternately) can be opened to the public. It is believed that the extension of time will be appreciated by visitors, particularly during the winter months, when hitherto the closing hour has been 4 P.M. The arrangements for opening on Sunday afternoons will not be altered.

ON Tuesday, before the Recorder of Dublin, the interesting action was heard of Charles Thorpe, a commission agent's clerk, against the Dublin Corporation, in which plaintiff sought to recover damages for injuries sustained through the alleged negligence of the defendants in their control of the city electric-lighting system. The plaintiff's evidence showed that on October 30 last, while in Grafton Street, he put his feet on the iron plate at the foot of an electric lamp-post, and immediately received a terrible shock, which threw him on the pavement. He felt as if he had been struck by hundreds of needles, was unable to close his mouth, and was made to dance about. A person who came to his assistance also received a shock. Witness had not yet recovered from the effects of the occurrence. For the Corporation, it was admitted that something was wrong with the electric light on the night in question, and evidence was given that no injuries were received by the plaintiff, though he might have received a shock. Professor Barrett, examined for the defendants, stated that he had studied this case and the system of electricity laid down, and in his opinion it was incredible and inconceivable that any injury could be caused by the conditions that existed at the time of the alleged occurrence, assuming that the Board of Trade regulations were at the time carried out. It was incredible that one man catching another who stood on this plate could have been affected by an electric shock. Darling, one of the plaintiff's witnesses, was recalled, and said he felt the shock on the footpath, and that he lost his senses and was thrown into the street. Another man who touched the plaintiff, thinking he had an epileptic fit, received a severe shock himself. The Recorder, in giving his decision, said that this was, dramatically, one of the most remarkable incidents that had occurred in the city. He was told that what had been deposed to was impossible to have occurred. He did not care a fig for what scientists might say in view of proved and certain facts. He did not, however, believe that the plaintiff was much injured, and would therefore make a decree for only 20/.

THE Secretary of State for Foreign Affairs has received a despatch from Her Majesty's Chargé d'Affaires at Madrid,

transmitting copy of a Royal Order inviting tenders for the construction and working of a telephone system in Tarragona. Sealed tenders will be received at the office of the Civil Governor of the Province of Tarragona for forty days, counting from the 11th inst. Further particulars of the conditions of the tenders may be inspected at the Commercial Department of the Foreign Office any day between the hours of 11 and 6.

ARTISTIC INTERIORS.

MESSRS. GRAHAM & BANKS, the well-known and very artistic firm of furnishers and decorators, of 455 Oxford Street, and to whose beautiful productions we have had on more than one previous occasion to refer, have just prepared a new edition of a charming book, "The House Comfortable and The House Beautiful," which, while ostensibly a trade catalogue, is really a work of art which it is a pleasure to examine, so charming and so numerous are the illustrations, which consist of views of complete interiors, fitted and furnished by Messrs. Graham & Banks, and a vast number of sketches of "fittings" and furniture in detail. These offer a wide range, comprising as they do all styles, while it may well be said that no article depicted leaves anything to desire on the score of taste, which is in all cases perfect, and the price of each is marked. Among so many designs of such uniform excellence it is almost impossible to particularise any one, but Messrs. Graham & Banks's Multiform Bedstead naturally attracts attention to itself by the ingenious economy of space by which, while looking like a French wardrobe when closed, space is found for a bedstead with spring mattress and bedding, washstand, toilet fittings, secrétaire, and stationery cabinet. Messrs. Graham & Banks inform us that they will be happy to send post free a copy of this beautiful and interesting book to any of our readers who write to apply for one.

METROPOLITAN THEATRE OF VARIETIES.

THE new music hall in the Edgware Road, which has arisen on the site of the old and successful Metropolitan, is a handsome structure erected from the designs of Mr. Frank Matcham. It is of fireproof construction throughout, and is amply supplied with entrances and exits, of which there are no fewer than nine. Ample fire extinguishing appliances are provided, and there is a curtain of iron and asbestos which completely isolates the stage from the auditorium.

LOUIS HARPER, A.M.I.C.E., ABERDEEN, N.B.
Contractor to Her Majesty's Colonial Government.

The stage has been enlarged, the latest and best appliances provided, and a new range of dressing-rooms has been added.

Mansfield stone of a light terra-cotta colour has been chiefly employed in the front elevation. Large spherical and dome-shaped windows, in which stained-glass is effectively used, help to break any unwelcome uniformity of line. Wrought-iron and glass awnings shelter the entrances at both ends of the building.

The principal entrance leads through a marble vestibule, paved with ceramic mosaic, with a lofty dome-shaped Moresque ceiling rich in colour and gilding, to the fauteuils and stalls; here, too, are four private boxes. These are on the level of the stage, whilst, approached by a few steps at their rear, two other handsome boxes flank the proscenium opening, somewhat below the balcony level. Of the two saloons for the convenience and refreshment of the ground-floor occupants, one is charmingly decorated (walls, ceiling and counter) in Burmantofts faience; the other is finished in walnut panelling, with alternate mirrors and tapestry of an original decorative character, the ceiling being treated in Louis XVI. style. The balcony is roomy and cosily upholstered, and every seat commands an unlimited view of the stage, as indeed, it may be mentioned *en passant*, does every seat in the house. This tier is provided with a bar saloon, which is handsomely decorated and appointed. The gallery, which holds from 800 to 900 persons, is light and capably ventilated. The style adopted in the internal decoration is Flemish Renaissance, the painting being almost entirely in various shades of ivory liberally embellished with gold. The whole of the upholstery, including the tableau curtain, is in two shades of dark crimson. This colour scheme gives a welcome sense of delicacy as well as richness, partaking in decorative effect more of the graceful method of the best continental opera houses than that of an English variety theatre.

The decorations are the work of Mr. James M. Boekbinder, who has achieved two notable triumphs in the painting on the asbestos fireproof curtain, which will be used as an occasional act drop, of a picturesque view of the Marble Arch, and especially in his treatment of the coved ceiling, in the four sides of which he has placed pictures of considerable size and beauty, which contain between fifty and sixty life-size figures—graceful and natural in every pose, and illustrative of "Old English Merry Making," "An Indian Festival," "French Carnival," and "Spanish Revelry." Crowning the pictured coves is the magnificent ceiling, a *chef d'œuvre* of plastic art.

The electric light has been installed throughout. The

sanitary fittings are by B. Finch & Co., Limited, the constructional ironwork by R. Moreland & Son, Limited, and the mosaic floors by Craven, Dunnill & Co., Limited.

WISE BENEFICENCE.

MONDAY last was a private view day of the latest completed addition to the series of Rowton houses which are springing up in various quarters, and which are unquestionably destined to effect a marvellous amelioration in the condition of the class of persons they are intended to benefit.

Originating in pure philanthropy on the part of Lord Rowton, the idea has germinated and sprouted and grown to the dimensions of a great public boon, while by dint of remarkably able management it is at the same time a financial success, yielding no less than 5 per cent. to its shareholders (for it has developed into a public company), after a fair amount has been set aside for wear and tear, deterioration, &c.

This is the third house which has been erected under Lord Rowton's auspices. Another is in course of erection at Hammer-smith, and there is plenty of scope for the company to still further largely extend, but for the difficulty they experience in obtaining suitable sites, which must, perforce, be large, and it is equally essential that they should be in crowded or at least in populous neighbourhoods.

The building in question has been erected upon a site with-in a few yards of Newington Butts and overlooks along its entire frontage a public recreation ground, which was formerly the churchyard of St. Mary, Newington, to which it has a frontage of 214 feet; it is 138 feet from front to back, with a superficial area of 27,850 feet.

The elevations are in pressed Leicester facing bricks, relieved with mingled gaults and dressings of pinky-buff terra-cotta from Mr. J. C. Edwards, Ruabon. The whole of the interior walling, excepting where glazed bricks are used, is built with gault bricks. All brickwork throughout the building has been built in Portland cement mortar.

The roofs to front elevations are covered with green slates, nailed direct upon coke-breeze concrete slabs, carried upon steel construction; all other roofs are flat, concrete and steel construction, covered with asphalt.

The floors are fireproof throughout, formed of concrete and steel, and the staircases and landings are in Portland cement concrete.

To avoid a cavity between surface of concrete and flooring,

WORKS, ROTHERHAM. Estab. 1854.

ART PLATES.

PROOFS on Special Paper of the beautiful frieze, by P. V. GALLAND, which was commenced in our Special Double Number of January 3, can now be obtained on application to the Publisher. They consist of five pieces, as follows:—

**Architecture,
Stone Cutting,
Bricklaying,
Carpentry,
Joinery.**

The Plates are produced in a light artistic brown, with a gold background, and form one of the best decorative examples which have appeared for many years past.

The size of each Plate is Fifteen Inches wide by Ten Inches in depth. As only a limited number of proofs have been taken, early application should be made.

The price is Ten Shillings the set, free by post in patent roller.

P. A. GILBERT WOOD.

A Complete List of Art Plates on Application.

the floor-boards are nailed directly upon the concrete to cubicle floors, and solid block floors are bedded directly thereon to all other rooms.

Especial care has been exercised in the planning and execution of all the sanitary work, both in the portion underground and the plumber's work.

Access is immediately obtainable to any portion of the underground work by the placing of inspection manholes at every change in direction of pipes. The entrance and corridor opening out from same to the various rooms and the two staircases are built in glazed brickwork from floor to ceiling, the dado formed in cream and chocolate-glazed bricks, and above ivory-glazed bricks, including the moulded cornice. The main entrance and screen-doors are in polished teak. Floor is cement and granite chippings. Oak seats are provided in positions out of the line of traffic in corridors. Water is laid on for drinking purposes in corridor next reading-room.

The floor space provided in the dining-rooms is 5,300 feet; seating is provided at tables for 440 men, and in addition a number of extra seats and wooden easy chairs are provided. The walls are built with a high dado of cream and chocolate tinted glazed brickwork, with plastering above tinted to a shade of terra-cotta. Pictures are hung in frames around rooms. The tables and seats are in teak on cast-iron standards. Four large cooking ranges, with ovens, hot plates and grills are provided out of the line of traffic in each part of rooms; large boilers at the back of two of these provide a supply of boiling water for lodgers for cooking, tea, &c.

The lodgers' scullery is placed between the two large dining-rooms, with access from both, and is a provision to enable lodgers who wish to prepare their own food for cooking to do so out of the dining-rooms. It is built in ivory glazed brickwork from floor to ceiling, and fitted up with twelve white enamelled fireclay sinks, with hot and cold water supply to each and teak draining boards. Large sanitary pails are provided for potato peelings, &c., and two for tea leaves.

The smoking-room adjoins the dining-room, and is approached from same and main entrance corridor. The floor-space is 1,600 feet. The tables and seats are teak, as in dining-room, and, as fitted, seat 112 lodgers; in addition, a number of seats and wooden easy chairs are provided around the two fireplaces. Glazed faience mantels and overmantels are provided and fitted with large open fires. Walls, glazed dado as in dining-room, plastered above and furnished with pictures. Floor, solid oak block.

The reading-room is at rear of building, and is an L-shaped room having an area of 2,550 feet. The walls have glazed brick dado with plastering to tint, as in dining-room. The seats and tables, in teak, provide for 169 men, in addition to a number of wooden easy chairs around the three glazed faience fireplaces, and in other parts of the room. Two bookcases, in polished teak, fitted up with books and cupboards for papers, &c., are provided. Books are lent to lodgers on application to superintendent. Pictures furnish walls as in other rooms on this floor.

Between the dining and smoking-rooms a lobby is formed giving access to this room. The walls are ivory glazed brickwork from floor to ceiling, and are fitted up with stout wood shelving. Crockery, cooking utensils, teapots, &c., are placed here for the free use of lodgers who wish to prepare their own food, and are collected by the company's officials from dining-rooms after use, and returned by lift formed in this room to basement scullery.

The shop is planned with windows at each end, opening into and giving a view of dining and smoking-rooms. It is lined with glazed tiles from floor to ceiling, fitted up with cupboards, drawers, shelving, sink, gas stove, hot plates and boiling-water apparatus, and stocked with goods to meet the varied requirements of lodgers. Lift to kitchen service-room. Tobacco license is held.

The bedrooms or cubicles are approached by two fireproof staircases, built in ivory glazed brickwork, situated at the extreme boundaries of the site and end of cubicle corridors, and are carried up to the roof. The disposition of the staircases renders it an impossibility for the lodgers to be trapped by fire in the event of an outbreak, as the cubicle corridors run from staircase to staircase, thereby leaving open a way for retreat in the event of access to one staircase being blocked. In addition, each floor is divided by divisional walls into ten sections, which would check if not stop the progress of a fire horizontally. The sectioning of floors also enables isolation and efficient fumigation in the event of a case of contagious disease.

There are six floors of cubicles, with a total sleeping accommodation for 804 men; each bed is in a separate cubicle, and every cubicle in the building has a window under the control of the occupant.

The portion of the cubicle partition next corridor is 6 feet 6 inches high, while the divisions dividing the cubicles are 7 feet 6 inches, leaving a space up to ceiling level free of partitions for ventilation.

AGENTS WANTED IN EVERY LARGE TOWN.

Vol. LVII. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.C.

The bedsteads are iron, fitted with wire woven mattresses, horsehair mattress and bolster, blankets, sheets and quilts, and each cubicle is provided with a chair, shelf, clothes' hooks and utensil.

The sanitary accommodation and appliances are of the latest and most complete description; hot, cold and filtered water is lavishly provided.

The lavatory and feet washing-room is 36 feet wide by 71 feet long, and has a French grey and ivory dado, with ivory walls and moulded cornices above same, all in glazed brickwork. There are eighty lavatory basins, white enamelled fireclay, fitted up with polished slate top, brass taps for hot and cold water supply to each basin, towel and hat rails. The waste pipes from each lavatory are discharged over an open white enamelled earthenware channel in floor, and the flooring is laid with falls to this channel throughout for cleansing and speedy drying.

The hot-water pipes are exposed, that the radiated heat may be utilised for warming lavatory.

A section 7 feet wide by 36 feet long has been divided off by an obscured glazed screen, 6 feet 6 inches high, to form a separate room for feet washing, fitted with twelve deep feet-washing troughs, with teak boards between each, and hot and cold water supply carried to each trough.

The bath-rooms are placed on each side of a corridor extending from lavatory to lodgers' washhouses at foot of front main staircase. They are each fitted up with ivory glazed fireclay baths, with teak bath tops and brass taps for hot and cold water supply. The walls and front of bath are in ivory glazed brickwork.

Two extra rooms are provided for use, either as bath or dressing-rooms, to enable lodgers to change their garments during the hours that access is not permitted to cubicles.

A large brilliantly lighted room is provided under reading-room as a barber's shop, and fitted up with hot and cold water and usual fittings.

Two rooms are provided and fitted up in basement corridor at base of two main staircases as workshops for shoemaker and tailor, and adjoining same are two bedrooms for use of male staff.

The lodgers' washhouse is separated from the foregoing corridor by a glazed screen, and is for the use of lodgers who may wish to wash their own garments. It is fitted with washing troughs in ivory glazed fireclay, draining boards in teak, hot and cold water supply to each, and a large heating

stove surrounded by a galvanised iron framework for the speedy drying of garments.

In short, nothing seems to have been forgotten or omitted which could tend to the health and comfort, even luxury, of the lodgers, who can at their option purchase at the merest fraction over first cost their food already prepared, or bring it in and cook it with the appliances provided free of charge, and the price for all this accommodation is only 6d. per night.

We should add that the whole of the work was executed by the company's own men, under the superintendence of the company's architect, Mr. Harry B. Measures, and Mr. G. J. Earle is the surveyor.

WATER SUPPLY AND EPIDEMICS.

THE Local Government Board have issued a circular letter to the clerks of town, urban district, and rural district councils, on "Water Supplies in Districts not Within Limits of Supply of Water Companies." It is dated December 17, and is as follows:—

Sir,—I am directed by the Local Government Board to call the attention of the council to the subject of the water supply of their district.

The importance of a wholesome supply of water need not be emphasised in view of the serious epidemics of enteric fever which have of recent years been brought about by specific contamination of water supplies in different parts of the country. It is true that this disease, which formerly prevailed somewhat generally in endemic form, has during the last twenty-five years been largely reduced as a cause of death; but, on the other hand, there is now a recurring tendency to sudden localised epidemics, in which the typhoid infection is distributed to large populations by means of the contamination of water delivered from public works of water supply.

The council are the body responsible under the Public Health Acts for securing to the inhabitants of their district a proper and sufficient supply of water, and the Board desire to impress upon them the importance of taking the matter into their serious consideration with the object of guarding their district against dangers, the gravity of which has been sufficiently shown by recent examples.

Where the council have themselves constructed or purchased any waterworks it is their duty, in pursuance of section 55 of the Public Health Act, 1875, to provide a supply of "pure and wholesome" water, and in order to fulfil this obligation it

behoves them to exercise every precaution to secure that the water which they deliver to the consumers shall be protected from risk of contamination, whether in connection with the sources from which it is derived or during the course of its storage or distribution, and that where means of filtration are necessary these should be adequate and maintained in a thoroughly efficient condition.

Not only are the council thus under a responsibility for the wholesomeness of the water which they themselves supply, but they should by careful inquiry make themselves acquainted with the sources, nature and quality of the various supplies in all parts of their district, and in every case in which the result of their inquiries is unsatisfactory, should take all such steps as may be within their powers with the view of supplementing or improving the supplies.

The Board would observe generally that accurate information should be procured, if not already available, in such matters as the following:—

1. *Where Water is derived from Gathering Grounds or from Springs.*

Whether drainage from human habitations, farmyards and the like finds its way, directly or indirectly, into the reservoir or to any part of the water service; and whether risk of access to the water of human excreta and similar refuse is likely to arise.

2. *Where Water is derived from Deep Wells.*

Whether surface or other water, liable to be contaminated by drains, sewers, cesspools and the like, reaches, or is liable to reach, the wells. The existence and direction of fissures in the strata deserve especial consideration in this respect.

3. *Where Water is derived from Shallow Wells.*

Whether the wells are so circumstanced that they run risk of contamination by reason of drains, privies, cesspools, or middens, or by the deposit of manure—whether derived from human excreta or not—in or on the ground in the neighbourhood of the wells.

The Board trust that the council will not fail to give their most careful attention to this subject, and that, where it may appear that further works which may be within the powers of the council for the improvement or protection of existing supplies are needed, the council will forthwith, with the assistance of such skilled advice as the circumstances of the case may require, execute the necessary works.

The Board request that a copy of this communication may be furnished to the medical officer of health.—I am, Sir, your obedient servant,
HUGH OWEN, Secretary.

THE METROPOLITAN ASYLUMS OFFICES.

A MEETING of the Metropolitan Asylums Board was held on Saturday last, when the works committee presented a report and plans of the chief office buildings to be erected on the Embankment site, together with the architect's descriptions. The committee stated that the architect's rough estimate of the cost of the buildings, including foundations and detached ventilating tower for the railway tunnel, was 49,543*l.*, and they recommended that the plans prepared by Mr. Edwin T. Hall, architect, be approved and adopted, and forwarded to the Local Government Board for their formal sanction under seal. In their report on the 4th inst. the committee called attention to the necessity of the excavations and concrete raft foundations of the new office buildings being proceeded with as soon as possession of the site was obtained, and they were authorised by the Board to advertise for tenders for the execution of the work. They had now received from the architect a specification for the execution of this work, the cost of which he estimated at 3,400*l.* Before, however, any expenditure could be incurred in respect of any portion of the proposed buildings, it would be necessary for the Local Government Board to issue an order authorising such expenditure, and they now recommended that application be made to the Local Government Board to issue a provisional order authorising the expenditure of (say) 40,000*l.* in respect of the buildings, and empowering the managers to raise the amount on loan. The recommendations were agreed to.

CRYSTAL PALACE SCHOOL OF ENGINEERING.

At the Crystal Palace on Friday Mr. John Aird, M.P., presented the certificates awarded by the examiners to the successful students connected with the Crystal Palace Company's School of Practical Engineering. There was a large attendance of students and their friends in the lecture theatre of the school. After the report of the examiners had been read the chairman congratulated the management of the school on the continued success which attended their efforts. Referring to the difficulty which parents encountered in finding employment for their sons

AGENTS APPOINTED IN ALL LARGE TOWNS.

after they left a school like this, he said that the solution lay to some extent in the advice lately given by Sir John Wolfe Barry, that students should learn some trade. Rather than lead an idle life and be a burden on their parents, students should go to a leading contractor and offer to work for daily bread, say, in the position of timekeeper. They must put their dignity in their pockets; they must be early risers and be constant in their attendance to their duties. Such a position as this would not only relieve their parents, but it would bring the students into contact with the workmen and give them opportunities to acquire knowledge which would be invaluable in their future career. He had himself followed the course he now advocated, for he served four years as a timekeeper in his father's works, one period of his service being during the construction of the Crystal Palace itself. The awards were as follows:—First year's course, drawing office—E. L. de Lautour. Pattern shop—C. E. Bristowe. Fitting shop—F. K. Peach and W. Simms (equal). Second year's course.—Civil engineering, first term—H. A. C. Yarborough; second term—O. A. G. St. John-Kneller; third term—F. G. A. Pinckney and J. W. Simpson (equal). Electrical section, first term—W. J. Wood; second term—S. C. Batstone and S. F. Mott (equal). Colonial section, first grade—J. A. L. Caesar, H. L. Edridge and A. F. Mortimer. Certificate of honour—F. G. A. Pinckney. Mr. J. W. Simpson was presented with a medal of the School of Art, Science and Literature, as he had obtained eight certificates, none of which were below third in order of merit. Votes of thanks to the officials and to the chairman closed the proceedings, the last-named suggesting that the time had now arrived for taking steps to inaugurate another great industrial exhibition to be held in London.

THE NEW BROADWAY THEATRE AT DEPTFORD.

THE new Broadway Theatre which Miss Cissy Graham has built at Deptford and opens on Boxing night is a conspicuous addition to the list of London suburban theatres. It will be interesting, however, to the general public no less than to the theatrical profession, from the fact that both constructionally and decoratively it reveals certain distinct and entirely new departures. The architect has been Mr. W. G. R. Sprague. The decorative scheme has been entrusted to S. J. Waring & Sons, and the feature of their beautifully artistic work has been the adoption of the vertical lines of the building as the basis of their work instead of the horizontal lines hitherto in vogue. The new building occupies a commanding corner position in the historic Broadway. Its frontage, worked in Portland stone in the free Italian style of architecture, with circular towers running up the front and surmounted with cupola roofs, presents a handsome appearance. The chief entrance is in a circular bay leading directly into the main reception hall. This interior is decorated in Cinque-Cento style. The prevailing colour are warm rich red-browns and gold, ceiling and walls being so treated. The corridors are similar, except that here a liberal use is made of a full ibis red. The foyer on the dress circle tier is similar in character to the reception hall, but the details are more delicate. In the auditorium, which is capable of accommodating some 2,500 persons, Messrs. Warings have done themselves the fullest justice.

CHURCH BUILDING SOCIETY.

THE Incorporated Society for Promoting the Enlargement, Building and Repairing of Churches and Chapels held its usual monthly meeting on Thursday last at the Society's House, Dean's Yard, Westminster, the Rev. Canon C. F. Norman in the chair. There were also present the Revs. Canon J. Erskine Clarke, Canon Utterton, H. E. Trotter and C. Wyatt-Smith, Messrs. James Hilton, E. Lee-Warner and J. E. Ollivant, and the Rev. R. Milburn Blakiston, secretary. Grants of money were made in aid of the following objects, viz.:—Building new churches at Basset, St. Michael and All Angels, in the parish of North Stoneham, near Southampton, 40%; Battersea, St. Bartholomew, Surrey, 300%; and Willesden, St. Matthew, Middlesex, 250%; and towards enlarging or otherwise improving the accommodation in the churches at Aberystwyth, Holy Trinity, 100%; Gorse Hill, St. Barnabas, near New Swindon, Wilts, 50%; North Searle, All Saints, near Besthorpe, Lincolnshire, 25%; and Hale Magna, St. John the Baptist, near Heckington, Lincolnshire, 50%, in lieu of a former grant of 35%. Grants were also made from the mission building fund towards building mission churches at Carlisle, St. Stephen, 20%; Coventry, St. Saviour, 25%; and Woolwich, St. John, 55% in lieu of a former grant of 40%. The following grants were also paid for works completed:—Enfield, St. Mark, Middlesex, 80%; East Tuddenham, All Saints, near Norwich, 5%; Willesden, St. Andrew, Middlesex, 135%; Kirtton in Holland, St. Peter and St. Paul, near Boston, Lincolnshire, 20%; Orford, St. Bartholomew, near

Wickham Market, Suffolk, 60%, balance of a grant of 100%; Hamnish, in the parish of Kimbolton, near Leominster, 10%; Ivyhouse, in the parish of Broadwood-Widger, Devon, 10%; Dwygyfylchi, St. David's, in the parish of Penmaenmawr, 50%; and Leytonstone, St. Margaret, Essex, 20%. In addition to this the sum of 611% was paid towards the repairs of eleven churches. The Society likewise accepted the trust of a sum of money as a repair fund for the church of St. Mary the Virgin, Burham, near Rochester. The grants voted at this meeting have completely exhausted the mission buildings fund. The committee feel that one of the great needs of the Church at the present time is the providing mission buildings in densely-populated districts and in widespread rural parishes, and they appeal earnestly to Church people to come forward with liberal contributions both to the general fund and the Mission Buildings Fund to enable them to give substantial grants to the many pressing cases that are being constantly brought before them, and to continue the valuable work which this Society has so successfully carried on during the past eighty years. The following resolution was passed unanimously. Resolved, "That the committee of the Incorporated Church Building Society desire to place on record their sense of sincere regret at the death of Mr. J. L. Pearson, R.A., who for thirty-nine years was a member of the committee of Honorary Consulting Architects. Until the last few years, when his advanced age prevented it, he was a regular attendant at the meetings of that committee, and bestowed great care and attention on the examinations of drawings submitted to the Society. The committee desire to express their sympathy with Mr. Frank L. Pearson in the loss he has sustained, and to assure him of the regard which they had for his father and of the high value they placed on his work for the Society."

THE CITY FIRE.

AT the inquiry into the origin of the fire in Cripplegate on the 19th ult. evidence was given, says the *City Press*, by Mr. Charles Jackson, secretary of the London office of the Royal Insurance Company. In answer to Mr. Crawford he said he had thirty-five years' experience in connection with insurance business, and was well acquainted with the district in which the fire occurred. There had been a strong objection on the part of insurance offices to insure premises in the district in question for some years past. The offices generally had not been taking what were regarded as full limits on any of the buildings in this locality. This referred to the offices in a collective sense. It was due to the character and construction of the buildings, the congestion of the traffic, the narrow thoroughfares and the large expanse of glass. The class of goods stored in the premises would naturally have considerable effect upon the minds of insurance directors.

Mr. Crawford: Is it the view of the insurance companies that the safety of the property and the public demanded a different construction of building?

Witness: A different type of building. Continuing, he said he was acquainted with well-holes and the lighting area of such buildings, and he regarded well-holes as a source of danger, as they were calculated to cause a fire to spread from one building to another. He had known several fires which had been caused by gas explosions. He had heard the greater part of the evidence given at that inquest, including that given by Professor Redwood, and he agreed with that gentleman's view that the fire could not have been caused by a gas explosion. He thought that the stack of goods which had been referred to must have been in contact with a light of some kind, but he could not account for any light coming in contact with it. He thought that if well-holes were fitted with iron shutters it might prevent a spread of fire, at least it would give buildings a better chance.

By the Jury: The insurance companies would more favourably consider the issue of a policy if that was done. The companies were always prepared to recognise anything of that sort. He was not aware that any portion of the ruins had been subjected to a chemical process.

A Juror: What is the average premium?

Witness: The average would be from a guinea up to 25s. per cent.

A Juror: Prior to the fire 25s. was the maximum?

Witness: We are getting more now.

A Juror: Is there anything left to insure?

Witness: I was speaking of the outer fringe of the fire.

Witness, in the course of further examination, said there were certain spots which were considered very dangerous, and insurance experts had always anticipated that, in the event of a serious outbreak of fire occurring in any one of these buildings, a large number might be involved. In block 212 there were twenty-two buildings, the upper floors looking into one common well-hole. As far as they could the insurance companies penalised matchboarding.

A Juror: Can you tell me the premium on fire-resisting buildings?

Witness: Where were they? A building would be rated on its merits.

A Juror: Would you be ready to recognise those merits?

Witness: Undoubtedly, we do so. Witness, proceeding, said it would be possible in an insurance for a floor to have a self-contained risk, but it would largely increase the initial cost of the building. The buildings which had been described by Mr. Penfold left certain of the ironwork exposed, and the present fire in that respect was an object-lesson. He would suggest that a large building should have its own distinct well-hole. So long as a number of windows looked upon a common well-hole, so long they might expect serious fires. Another fruitful source of mischief in the spread of a fire was the internal lifts. Those lifts, as a rule, were simply enclosed with a thin boarding, but the insurance companies would like to see iron doors and the lifts carried through to the roofs in the form of a parapet. At present each floor of a building caught fire simultaneously, and the lift acted like a chimney shaft.

A Juror: Is that the mode of construction at Winchester House?

Witness said he thought the only lifts were passenger lifts, and one or two others which were used by Spiers & Pond, Limited. They would be enclosed with woodwork, which was not the kind of thing he liked. The only two cases of fire he could trace at Winchester House were one which occurred in December, 1890, when a quantity of rubbish was destroyed, and another, on June 24 last, when some rubbish was burnt in a store-room in the front basement. In fires like the present the buildings burnt downwards from roof to roof, and he suggested that in future the roofs of warehouses should be flat in such congested areas, and that the party walls should rise and form a parapet not less than 3 feet high. That would not only improve the building, but afford shelter to the members of the Fire Brigade. Another feature which the insurance companies would like to see abolished was the use of thin matchboarding in the ceilings. Another thing was that all the windows in the street frontages of these buildings were unshuttered. With regard to buildings in equally small streets in other portions of the City, it should be remembered that there was not generally the multiplicity of tenure as in the locality in question.

Mr. Crawford: I don't want to cause any unnecessary alarm by saying that because streets in the City are narrow they are dangerous. It is, I suppose, in the character of the buildings and their contents that the risk lies?

Witness: Yes, that is so, undoubtedly.

Mr. Crawford: Have you ever come across a single fire where you have found it assume such fierce proportions, and in such a short space of time as in this case?

Witness: No; not in so short a time.

Witness went on to say that there had been fires which spread very rapidly in a similar class of building. There was the fire which broke out in Great Eastern Street in 1888. That was a modern thoroughfare. There was also a fire which assumed the character of a conflagration in 1885 in Charterhouse Buildings. There was also the St. Mary Axe fire in 1890, and, in 1896, the fire in Colonial Avenue in the Minories, and the large fire in Tabernacle Road. The buildings in the above-mentioned cases were similar to those under discussion. The fault was no doubt in their construction. Witness suggested that Mr. Penfold should make an appointment with the insurance surveyor to discuss the question of the construction of buildings. The rapidity with which the present fire spread was marvellous. He had never known anything like it before. The insurance companies had nothing to do with the management of the brigade. They paid 35% for every million pounds insured.

A Juror: Do you attach any importance to the keeping of fire appliances beyond hydrants on premises like these?

Witness: Amateur appliances like hand grenades, &c., would be useful if they could be applied a few moments after the outbreak, but not afterwards.

LAND-SLIDES ON RAILWAYS.

AT the ordinary meeting of the Institution of Civil Engineers on the 14th inst. a paper on "The Great Land-Slides on the Canadian Pacific Railway in British Columbia" was read by Mr. Robert B. Stanton.

Since the opening of the Canadian Pacific Railway in 1885 great trouble and expense has been caused by large land-slides on a section of the line which followed generally the contour of the east and south-east bank of the Thompson River, at an elevation of about 65 feet above low-water level, about 197 miles east from Vancouver. Within a distance of 6 miles there had occurred seven great slides, six of which crossed the railway line, and several smaller slips; and at a point 20 miles further down the river, opposite Spence's Bridge, another large slide had taken place. The largest slides occurred where the

river traversed a gorge, above which the surface of the land rose in benches and terraces extending to a general altitude of about 1,000 feet above the river. These terraces were under cultivation, for which artificial irrigation had to be resorted to, the water being carried on to the land from the mountain streams and lakes by ditches. The two greatest slides had occurred before the railway had been built, and were situated one north and the other south of two hard sandstone points in the narrowest part of the gorge, penetrated respectively by the Black Canon Tunnel and an open cut. The south slide had an extreme length of 1,880 feet along the railway, and an extreme width back from the river of 1,575 feet. It was of somewhat irregular form, with a semicircular outline at the back, and covered an area of 66 acres. On the land above the slide irrigation had continued since the railway had been working, and had kept up a continual movement towards the river. This movement was more marked for 500 feet or 600 feet in the centre of the slide, where the water seemed now to be concentrated. At times the road-bed had sunk 4 feet and had moved out twice that distance in a night, so that constant rebuilding of the line had been necessary for the last ten years. The movement was continuous, though it was greatest in the months of July, August and September. An extra force of section men, watchmen, construction trains, &c., was continually necessary on this section. At the south slide alone over 10,000% had been spent on such work; and the section of 5 miles or 6 miles of slides had cost the Canadian Pacific Railway Company directly and indirectly 100,000% in maintaining a safe road-bed. The north slide had a maximum width of nearly $\frac{1}{2}$ mile, and a length back from the river approaching $\frac{3}{4}$ mile, with the same semicircular back line, and was of irregular form, and 155 acres in extent. Irrigation had been carried on above it for some years, and some time before the final catastrophe occurred a reservoir 2 miles distant in the hills had broken through its dam, and most of the water thus liberated spread over the upper benches of this land, already well soaked. The whole tract sank vertically in one movement to a depth at the back edge of over 400 feet. The lower portion, about 2,000 feet wide, was forced entirely across the river, a distance of 800 feet or 1,000 feet, and filled the whole inner gorge of the valley, forming a dam 160 feet high, with a lake 12 miles in length above it. The height of the first bench next the river, in both cases, was originally about 80 feet above low-water level. The land then rose in successive levels to a height, on the south slide, of 400 feet to the bench at the top, or back edge, where the cave-down broke off from the solid ground, and in the case of the north slide it extended to the third higher bench to a height of 500 feet above the river. It was estimated that at the back edge of the south slide the break fell almost vertically for a distance of over 300 feet. The ground consisted of light sandy loam to depths of between 1 foot and 8 feet, then 3 feet to 10 feet of clean coarse river sand, next loose and nearly clean stratified gravel and boulders, and below this partially cemented gravel with larger boulders. The material holding the gravel and stones together was a porous sandy clay silt through which water passed freely, but which in a dry state would stand in vertical walls to a considerable height. It extended to a greater depth in the higher terraces, in places, perhaps, to 500 feet. The silt lay in masses between 200 feet and 1,000 feet in thickness, and was generally fine and of uniform texture, and usually well bedded in horizontal layers of from $\frac{1}{4}$ inch to 3 inches or 4 inches thick. In its natural state it was hard and dry, like a soft sandstone, and when held between the fingers and struck with a light hammer rang like stone. A large piece of this silt, however, placed in a basin of water after a few minutes dissolved and mingled with the water, forming a semi-fluid mass. The same soft mixture had been observed oozing out at many points along the foot of the slide, forced out by pressure from above. By the continued application of large quantities of irrigation water upon the cultivated fields above and upon the upper portions of the slides almost the entire surplus not taken up by the plants or evaporation sank down freely through the loose soil, sand and gravel, and through the boulder clay, reaching the underlying silt. After some years this water saturated the argillaceous silt and converted it into the form of river mud. Long before the whole mass reached a state of perfect saturation the silt would lose its power of sustaining weight; and finally, when so large a body of the silt had become saturated to the extent that it could not sustain even its own weight except in its confined position, and the limit of resistance, possibly in the form of an arch, of the boulder clay having been reached, the great mass of earth and boulders above—in the case of the south slide estimated to weigh about 32,000,000 tons, and of the north slide approaching 100,000,000 tons—dropped almost vertically, while the immense tracts of broken and mixed material seeking an outlet forced their lower sides out on the line of least resistance and found their way into the river.

In further discussing the causes of the slides the author showed that neither natural precipitation upon the land nor natural surface drainage from the watershed above it, nor even

natural drainage by subterranean streams, could have been sufficient to produce such results. Neither could they be attributed to the effect of surface streams running by the land; and the only remaining explanation was that the artificial irrigation had acted in the manner described. There was no way, therefore, of preventing the continual disastrous effects upon the railway except by cutting off the irrigation water. This had been and could be made effectual, the water so easily absorbed as easily drained out, and the mass after a time again became firm and solid.

ASPHALTE PAVING.

A COMMITTEE of the American Society of Municipal Improvements was lately requested to prepare instructions relating to "What constitutes an asphalt pavement in good repair, particularly with reference to the condition the pavement should be in at the expiration of the guarantee?"

The following reply was given:—

Your committee have earnestly taken up this question, and have endeavoured to formulate definite and satisfactory specifications governing the point under consideration.

The principal features to be considered in examining an asphalt pavement to be placed in condition for acceptance are, first, the thickness compared with that of the original; second, the extent of disintegration; third, depressions or elevations; and, fourth, the length, breadth, direction and character of the ruptures.

Heavy traffic and constant sweeping or scraping are the main causes which reduce the wearing surface in thickness. Extended observations and inquiries show that the decrease in thickness of asphalt pavement after five years of use is so small as to be of little consequence even in case where the amount of traffic has been excessive. Disintegration, or the separation of the mixture into its various ingredients by the action of the elements can generally be attributed to the use of poor materials, to an improper mixture, or to neglect in manipulation. As these features are wholly within the control of the contractor, it is clear that he should be required to renew all places showing the least signs of disintegration.

Settlement of trenches beneath the pavement, shoving of the asphalt by travel, buckling of the concrete foundation, and expansion of the wearing surface will produce depressions and elevations on the surface of the pavement, which mar the

appearance of the street and interfere with the traffic. When due to either of the last three causes they are clearly created by faulty material and workmanship, and the contractor should be required to remedy such defects.

Depressions caused by the settlement of trenches cut into the street before the contract is signed should be made good, as the contract in such cases is taken with a full knowledge of the facts. But a grave injustice is frequently done the contractor and the pavement by cities arbitrarily cutting deep trenches in the street for the purpose of laying gas, water or sewer mains and services after the contract is signed or the work of paving has begun, and compelling the contractor to become responsible for such work.

One of the most serious defects of asphalt pavements in certain sections of the United States is the formation of cracks by the contraction of the asphalt during sudden and extreme changes in temperature. These variations in temperature are so extreme in certain localities that it has been impossible with the mixtures now used to prevent rupture of the pavement without laying the material so soft that it soon forms waves and ridges, which are more detrimental to traffic than the cracks. In localities subject to changes in temperature, sufficiently severe to cause extensive cracking of the pavement, it would appear wise to provide for such contraction and expansion by separating the pavement into separate blocks at stated intervals in the same manner as is now done on cement walks and kerbs. These divisions should be at such intervals along the length of the street that the spaces will allow the mixture to expand without forming ridges, and the contraction will not produce separations sufficiently large to be objectionable.

In considering this question the chairman of the committee made personal examination of the condition of pavements composed of the various kinds of asphalt, after having been laid for a period of five years or more in Chicago, Buffalo, New York, Brooklyn and Washington, and also gave due weight to the condition of the pavements in Cincinnati, Indianapolis, Pittsburg and Philadelphia, which had been previously visited and the asphalt pavements inspected. In the examination the particular points considered were the decrease in thickness, the formation of rolls and ridges and cracking of the surface. The object sought was to determine the causes, extent and responsibility of these defects by an inspection of pavements laid with the various kinds of asphalt under different climatic conditions, in order to provide guarantee stipulations that would be general in character and be fair to municipalities and contractors.

THE WELL-KNOWN FRIEZE,

ENTITLED

"THE CORN FIELD."

1. Ploughing.

2. Harrowing.

3. Mowing.

4. Carting.

5. The Products of the Corn Field.

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

A SPLENDID EXAMPLE OF COLOUR-WORK IN PERMANENT INK PHOTO, BY
M. PAUL ALBERT BAUDOIN.

This magnificent illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—THE LADY'S PICTORIAL.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—THE STAGE.

"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—THE GENTLEWOMAN.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 STRAND, W.C.

May be had framed in Solid Oak Frames with Mounts, at Three Guineas the set of Five Plates.

Your committee have also consulted with prominent engineers and contractors, and present with this report the views regarding the condition of an asphalt pavement at the end of the guarantee period of Mr. E. B. Guthrie, chief engineer, Buffalo, N.Y.; Mr. E. P. North, consulting engineer to the Department of Public Works, New York; Cranford & Co., paving contractors, New York; and Mr. Philip W. Henry, of the Barber Asphalt Company.

Your committee does not consider it possible to give definite specifications for this work that will be applicable to all localities, but after a careful consideration of all the facts obtainable, and after due consideration of the opinions presented, we would recommend that the following clauses, modified as found necessary for each locality, be included in the guarantee contracts of the cities belonging to the association.

Section 1. The pavement shall not be reduced more than one-fourth of an inch from the original thickness at the end of the first five years, nor more than one-half of an inch from the original thickness at the end of the first ten years. This requirement shall not apply to pavements constructed of rock asphalt, as this material does not receive its ultimate compression for a considerable period after being laid.

Section 2. Places which show a disintegration of the material shall be removed to the binder or concrete foundation, as found necessary, and replaced with new material having the same thickness and conforming to the adjacent pavement.

Section 3. All elevations or depressions three-eighths of an inch or more above or below the general surface of the street shall be brought to the same elevation as the general surface. These elevations and depressions to be determined by measuring from a straight edge 4 feet in length placed on the surface of the pavement parallel to the line of curbing. In making such repairs the process known as "skimming" may be employed.

Section 4. Where elevations or depressions are due to the failure of the concrete foundation from any cause the asphalt and concrete shall both be removed a length and width sufficient to include the entire defect.

If the failure is due to buckling of the concrete, the new foundation shall consist of broken stone thoroughly compacted, and of the same thickness as the original concrete. In all other cases a new foundation of concrete shall be placed of the same quality and thickness as the original construction. Upon the foundation shall be placed the pavement of the same thickness as the adjacent surfaces.

Section 5. Cracks which show any indication of disintegration, or which are three-eighths of an inch or more in width, shall be cut out of the binder or concrete foundation as found necessary, a length and width sufficient to include the entire portion affected. This portion to be replaced with new material of the same quality and thickness as shown in the pavement adjacent thereto.

Section 6. Should it be found necessary to replace 40 per cent. or more of any section of the street with new material, the entire section shall be resurfaced.

Your committee would also recommend that the indefinite and unjust requirements that the pavement shall be satisfactory to one officer, or set of officers, of the city, at the end of the guaranteed period, with no definite requirements of condition be omitted from guarantee clauses.

Your committee would further recommend that the city engineers of this Society maintain a record of the traffic on the paved streets in their respective cities, in order to determine the most durable pavement and the best pavement suited to specific requirements of traffic.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

28988. Henry Drummond, for "Improvements in tops for chimney and ventilating shafts."

29240. Earnest Alexander Claremont Hulme, for "Improvements in and relating to ceiling roses and other like fittings."

29263. Charles Hannay, for "Improvements in firebricks, slabs or tiles."

To INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE NEW EXPANDED METAL

Meshes from $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{3}{16}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

THE EXPANDED METAL COMPANY, LTD.

39 UPPER THAMES STREET, LONDON, E.C.

Telegraphic Address, "Distend," London.

Works—WEST HARTLEPOOL.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

BELPER.—Jan. 8.—The Belper Rural District Council offer premiums of 15 guineas and five guineas for the two best sets of plans and reports for Crich water supply. Mr. Joseph Pym, clerk, Belper.

BELPER.—May 1.—The Belper Urban District Council offer premiums of 50 guineas and 25 guineas for the two best schemes of sewage disposal. Mr. Joseph Pym, Urban District Council Offices, Belper.

PORT ELIZABETH.—Feb. 15.—The public library committee offer prizes of 100 guineas and 50 guineas for designs for a new library building. Messrs. Wm. Savage & Sons, 85 London Wall, London, E.C.

SINGAPORE.—May 31.—The committee of the Singapore Permanent Memorial of Her Majesty's Diamond Jubilee invite competitive designs for a town hall and theatre to be erected at Singapore (Straits Settlements) at a cost not exceeding 300,000 dollars. The committee offer a premium of 200l. for the design that may be selected for the work, and one of 100l. for the design which the committee may judge to be second in merit. Plans and particulars can be obtained from Major F. J. Anderson, R.E., Royal Engineers' Office, South Camp, Aldershot.

CONTRACTS OPEN.

ABERDEEN.—Jan. 5.—For taking-down and erecting walls and outhouses at Berryden Road. Mr. Wm. Dyack, burgh surveyor, Town House, Aberdeen.

BATLEY.—Jan. 5.—For erection of a residence in Dark Lane. Mr. W. Rhodes, architect and surveyor, Deighton Lane, Healey, Batley.

BEDFORD.—Jan. 10.—For building offices and storerooms at the electricity works. Mr. T. S. Porter, town clerk, Town Hall, Bedford.

BELFAST.—Jan. 4.—For fitting-up water-closets at the lunatic department, and new bathrooms, &c., at the fever hospital of the workhouse. Messrs. Young & Mackenzie, engineers, &c., Donegall Square East.

BEN RHYDDING.—Jan. 10.—For erection of a residence. Messrs. Empsall & Clarkson, architects, 7 Exchange.

BOLTON.—For rebuilding the Robin Hood Inn, Halliwell Road. Mr. C. H. Openshaw, architect, 6 Fleet Street, Bury.

BOX.—Jan. 10.—For erection of a villa residence. Mr. W. H. Stanley, architect, Market House Chambers, Trowbridge.

BRECON.—Jan. 5.—For erecting intermediate schools at Builth Wells, Breconshire. Mr. Telfer Smith, architect and surveyor, Market Hall Buildings, Builth Wells.

BRENTWOOD.—Jan. 5.—For alterations to officers' mess-room at Union schools. Mr. W. A. Finch, architect, 76 Finsbury Pavement, E.C.

BRIGHTON.—Jan. 4.—For alteration and enlargement of the York Place higher grade school. Messrs. Thomas Simpson & Son, 16 Ship Street, Brighton.

BURLEY-IN-WHARFEDALE.—Jan. 13.—For erection of National school for 500, with out-offices, boundary walls, &c. Mr. Ed. C. Brooke, architect and surveyor, 4 Huddersfield Road, Brighouse.

CROSSGATES.—For erection of four terrace houses. Mr. William Walker, Albert Mount, Horsforth.

CUMBERLAND.—Jan. 9.—For erection of house and out-buildings at Kirkbride. Mr. E. Hill, grocer, Kirkbride.

DARTFORD.—Jan. 17.—For erection of a surrounding wall surmounted by an iron palisade, chapels and caretaker's house, and other buildings, on the site of new cemetery at Stone. Mr. G. H. Tait, Lowfield Street, Dartford.

DARWEN.—Jan. 3.—For erection of a boiler-house and settings for two boilers at gasworks. Mr. Chas. Costeker, town clerk, Darwen.

DOVER.—Jan. 18.—For erection of a boiler-house, with inlet pipe, &c., at the sea baths, Marine Parade. Mr. Henry E. Stilgoe, engineer, Town Hall, Dover.

EARLSHEATON.—Jan. 3.—For alterations and additions to works at Old Bank. Mr. James C. Haller, 5 Savile Road, Savile Town, Dewsbury.

EPSOM.—Jan. 24.—For erection of temporary structures for 700 patients and staff at the Morton House Estate. The clerk of the asylums committee, London County Council, 21 Whitehall Place, S.W.

ESSEX.—Jan. 13.—For erection of infirmary, casual wards, labour master's house, boiler-house and additions to existing infirmary, at Billericay workhouse. Mr. A. T. G. Woods, architect, New Road, Brentwood, Essex.

HARWICH.—Jan. 15.—For additions to the present school-room and for new pulpit, reseating, &c., at the Congregational church. Mr. J. W. Start, architect and surveyor, Colchester.

HUDDERSFIELD.—Jan. 4.—For extension of the electric-supply station. The Town Clerk, Town Hall, Huddersfield.

HUDDERSFIELD.—Jan. 3.—For erection of seven dwelling-houses in Moor Lane, Netherton. Mr. J. Berry, architect, 9 Queen Street, Huddersfield.

BERRY, CAMPBELL & CO.
WARMING & VENTILATING ENGINEERS,
62 WATLING STREET, QUEEN VICTORIA STREET.

Heating by Hot Water, or High or Low Pressure Steam, expeditiously carried out on the most approved principles. Special attention given to Private Residences.

ESTIMATES FREE.

IRELAND.—Jan. 3.—For construction of a urinal through wall and under Fair Hill at north end of town hall. Mr. W. G. Young, town clerk, Larne.

IRELAND.—Jan. 14.—For erection of municipal offices and stores at George's Place. Mr. John Donnelly, town clerk, Town Hall, Kingstown.

IRELAND.—The committee of the Dromahair Dairying Society invite tenders for erection of creamery. Mr. John O'Rourke, secretary, Dromahair.

KIDLINGTON.—Jan. 4.—For erection of two cottages at Kidlington station, Oxfordshire, Great Western Railway Company. Mr. G. K. Mills, secretary, Paddington Station, London.

LANCASHIRE.—Jan. 17.—For erection of three cottages at Ireleth. Mr. R. P. Nelson, surveyor, Broughton.

LANCHESTER.—For erection of six houses. Mr. John Buckham, timber merchant, Lanchester.

LEICESTER.—Jan. 13.—For raising the present roof of the boiler-house at the refuse destructor works, Nedham Street, and other work. Mr. E. George Mawbey, surveyor, Town Hall, Leicester.

LEWISHAM.—Jan. 13.—For erection of buildings to accommodate about 800 persons, together with the necessary administrative offices, at Slagrove Farm, Ladywell. Messrs. Newman & Newman, architects, 31 Tooley Street, London Bridge, S.E.

LYNDHURST.—Jan. 10.—For erection of the following additions to Holmfild, Lyndhurst:—(1) A range of stabling, with coachman's cottage and groom's apartments; (2) a billiard-room as specified; (3) a greenhouse; (4) sundry alterations throughout the present house, comprising a complete renewal of sanitary arrangements and water supply. The Hon. G. Lascelles, Queen's House, Lyndhurst.

MANCHESTER.—Jan. 10.—For erection of thirteen shops, Oldham Road. The City Surveyor, Town Hall, Manchester.

MANCHESTER.—Jan. 10.—For erection of twenty-six three-storey tenement buildings and two corner shops, fronting Pott Street and Caroline Street, Ancoats. The City Surveyor, Town Hall, Manchester.

MITCHAM.—Jan. 26.—For erection of visitors' room and engineer's house at the schools, Mitcham. Mr. C. E. Vaughan, architect, 25 Lowther Arcade, Strand, W.C.

OTLEY.—Jan. 4.—For erection of offices at Atlas Works. Messrs. Fairbank & Wall, architects, 3 Manor Square, Otley.

POOLE.—Jan. 5.—For alterations and additions to the gas service at the workhouse, Longfleet, and for providing and fixing new cast-iron guttering. Mr. H. F. J. Barnes, architect, Towngate Street, Poole.

PLEASLEY.—For erection of additions to Board schools, Shirebrook. Mr. Frederick Ball, architect, 23 King Street, Nottingham.

RADCLIFFE.—Jan. 11.—For erection of public baths, and supplying and fixing of all engineering work, hot and cold water systems, and all connections and fittings complete. The Engineer, Council Offices, Radcliffe.

RYTHER.—Jan. 12.—For restoration of church. Mr. C. Hodgson Fowler, architect, The College, Durham.

SALISBURY.—Jan. 4.—For erection of engine-shed and retaining wall and construction of three engine-pits, for the Great Western Railway Company. Mr. G. K. Mills, secretary, Paddington Station.

SCOTLAND.—Jan. 3.—For erection of villa on West Terrace, Kingussie. Mr. Alexander Mackenzie, architect, Kingussie.

SCOTLAND.—Jan. 15.—For alterations on two houses in the village of Archiestown. Mr. D. Maclean, blacksmith, Archiestown.

SCOTLAND.—For erection of the town and county bank, buildings at Craigellachie. Messrs. Dunn & Finlay, architects, 35 Frederick Street, Edinburgh.

SCOTLAND.—Jan. 8.—For erection of extensive warehouse and brewer's house at Tomatin Distillery. Mr. Alexander Mackenzie, architect, Kingussie.

SHOEBURYNNESS.—Jan. 8.—For erection of Victoria Hall. Mr. W. Cox, churchwarden, High Street, Shoeburyness.

SHREWSBURY.—For additions to the hotel at Church Stretton. Mr. John R. Withers, architect, Shrewsbury.

SOUTHAMPTON.—Feb. 1.—For erection of an isolation hospital on land in Mousehole Lane, Millbrook. Messrs. Greenaway & Smith, architects, 21 Queen Anne's Gate, Westminster.

SOUTHBORNE.—Jan. 6.—For additions and alterations to the Board school at Southbourne, about $\frac{1}{2}$ miles from Emsworth. Mr. N. C. H. Nisbett, architect, 62 High Street, Winchester.

WALES.—Jan. 7.—For building an hotel, with stables, at Llanilleth, Mon. Mr. C. Telford Evans, architect, 8 Queen Street, Cardiff.

WALES.—Jan. 5.—For conversion of Plasnewydd House, Maesteg, into a school for the higher standards. Mr. E. W. Burnett, architect, Tondur.

WALES.—Jan. 25.—For erection of a school for girls, and alterations to existing boys' school. Mr. H. Teather, Andrew's Buildings, Queen Street, Cardiff.

WALMER.—Jan. 5.—For erection of a public convenience near the Strand Promenade and for fencing and levelling the site of the new recreation ground, Campbell Road. Mr. J. E. Turner, 2 Cornwall Road, Walmer.

THE LAND TRANSFER ACT, 1897.

The clerk to the Board of Works for the Lee district has presented a report to the board, dated December 22, with regard to the Land Transfer Act, 1897. He points out, with regard to the letter from the London County Council of the 25th ult., that Parliament has left to the County Council to decide whether the Act shall be first tried in London. Before deciding the matter the Council had invited the opinion of the board, and the clerk points out, with regard to the registration required of any transaction affecting land or houses, that for the following reasons the first experiment of compulsory registration under the Act should not be made in London:—Registration would be expensive, cause delay, would not prevent fraud; that it had been tried and found wanting; that the new Ordnance maps should be awaited; and, finally, that London is not the best place for the experiment. The board, after considering the report, passed the following resolution:—"That the clerk's report of this date be approved, and that the London County Council be informed that, in the opinion of this board, compulsory registration is not at present desirable in London, and that the Council be urged to object thereto, and that the clerk is instructed to write to the Council accordingly, and enclose a copy of his said report."

TRADE NOTES.

THE offices for Messrs. R. F. Hall's, Limited, new cycle works, Aston, Birmingham, are being warmed and ventilated by means of Shorland's patent Manchester grates.

MESSRS. THOS. H. TOY & CO. announce that on January 1, 1898, they will commence business at 17 South Street, Finsbury, E.C., as importers and dealers in all descriptions of glass and metal supplies connected with the electric, gas and oil trades.

THE chancel of Knighton Church, Radnorshire, has recently been restored and refitted. A handsome set of choir stalls has been added to the design of the late J. L. Pearson, R.A. These, in addition to the other chancel fittings, were executed by Jones & Willis, of Birmingham and London.

MESSRS. G. & F. COUZENS, of Tudor Road, Cardiff, send us a neat little pocket catalogue of their patent ball and flap valve gully traps, ball valve and syphon interceptors or inspection chambers, patent ball valve water-closets, &c. It is a very little book, but will no doubt be found handy by users of such commodities.

WE have received a specimen of the new "wire-rolled glass," which is worthy of a word or two in commendation. The novelty consists in the glass containing in the centre of its thickness a wire netting, the advantages of which are manifold and manifest. Among these may be mentioned the following:—It is not unsightly, although obviously unsuitable for some positions, as living rooms or shop windows; stones cannot be thrown through it; it is burglar-proof to the extent that a piece cannot be cut out or broken through without great trouble; and it resists fire as long as the same thickness of iron would—the glass is cracked into small pieces by the heat, but will not fall and thus cause draught.

BUILDING AND BUILDERS.

THE Corporation of Cambeltown have resolved to carry out an extension of the pier at a cost of 4,000l.

GROUND has been acquired at the Slates, Kilmalcolm, for the erection of a home to accommodate 100 sailors' orphans.

AN inquest was held by Coroner Dodds at West Hartlepool on Christmas Eve touching the death of a labourer named Michael McOwen, who was killed by falling from a ladder whilst taking down the scaffolding used in altering the front of the Market Hotel, Lynn Street. The evidence showed that no one was in any way to blame for the occurrence, and a verdict of "Accidental death" was returned. Messrs. Henderson & Sons, the owners of the property, generously headed a subscription list for the deceased man's family of six with a donation of 25l.

A CONTRACT has been signed for the enlargement of Medland Hall, by which accommodation will be provided for 150 additional homeless men, thus increasing the total number that can be received to 450 nightly. This additional room will be obtained by enlarging the present top floor and building another storey above it. The inside staircase from top to bottom will be of 2-inch oak in every part, this wood being adopted because it chars rather than flames in the case of fire, and an iron staircase will be fixed outside the building, ready access to it being obtainable from all the floors. The entire cost will be 2,200l.

PLANS have been prepared for a complete renovation of Queen Anne United Presbyterian church, Dunfermline, the original congregation of which was formed by Ralph Erskine when he was deposed from the Abbey. The church, which occupies a commanding site on elevated ground at the junction of Bath Street and Queen Anne Street, is to be practically gutted from floor to ceiling, both inclusive. The present pews, which are much out of date and uncomfortable, are to give place to modern seats with a greater width, and the gallery is to be so reconstructed as to form a semicircle. The present pulpit is to be removed, and behind its site a pipe organ is to be built. Improved methods of heating and ventilation are to be introduced, and by the alteration of the gallery more light will be afforded in the area at the back of the church. It is expected that the carrying out of the scheme will cost at least 3,000l.

AVOID FREEZING OF PIPES, ETC.

Blue Cape Asbestos Covering, the Lightest, most Durable, and most Effective Removable Covering extant, to prevent Freezing of Pipes, Cisterns, &c., &c., in Private Houses and Public Buildings.

Messrs. JOHN BARKER & CO., Limited, Kensington, write to us as follows:—"We have pleasure in stating that the work done by you is entirely to our satisfaction, so much so that we shall have pleasure in becoming your customers whenever opportunity offers. A full list of your specialties will induce business.—We are, &c., &c."

GRAVES' PATENT ROOFING CO., 14 WATER STREET, LIVERPOOL.

OPERATIONS have commenced in the construction of the Banbury branch of the Great Central Railway. The new line leaves the main line of the Great Central at Culworth, about nine miles from Banbury, at a point on Lord Valentia's Eydon estate. It passes through a rich grazing district and one well known to the followers of the Bicester Hounds. With the exception of a long deep cutting between Thorpe Mandeville and Chacombe, the works are comparatively light. The steepest gradient is 1 in 132. The line will be a double one, and will join the Great Western Railway about a mile to the north of Banbury station. The Act obtained for the construction of the line allowed for a capital of 200,000*l*. The engineers are Sir Douglas Fox and Mr. Francis Fox, and Messrs. Walter Scott & Co., of Newcastle-on-Tyne, are the contractors.

ELECTRIC NOTES.

THE Vestry of Hammersmith has resolved to extend its electric-lighting plant, including public and private lighting mains, with new engines and dynamos.

ELECTRICALLY driven locomotives of great power are coming into service in America, the *Pittsburg Post* recently reporting the haulage by one of them of a train of eleven Pennsylvania cars, each carrying 125 people, and also a baggage car round a curve and up a 4 per cent. gradient.

A WEEK ago the last horse tram was taken off the streets of Buda-Pesth. The whole of the tramway lines have been converted into electric lines for a length of seventy English miles, while the Buda-Pesth underground railway also has electric traction for a further distance of fifty-three miles. This is not bad for a town of only 600,000 inhabitants, but the Hungarians are not yet satisfied, and plans for an extensive system of electric elevated and underground railways have just been made public and received with general approval, like everything else tending to embellish or improve the thriving city. At the present time Buda-Pesth is the only large town in Europe in which the horse has been banished from the streets so far as the trams are concerned.

THE electric-lighting experiments which the London and North-Western Railway Company have been carrying on in connection with their Watford traffic have proved so successful that other companies are already adopting the system. Several of the larger lines, of course, have had some system of electric-

lighting in use for some years. Lighting by electricity has the great advantage, from a railway manager's point of view, that when once the installation has been made the cost of lighting trains makes little show in the annual balance sheet. The power is obtained from the engine of the train, and the comparatively slight increase of fuel necessitated makes no perceptible difference in the accounts. Stone's system, which has met with such approval by the London and North-Western Company, will shortly be in use on sixty different railway systems. The new royal train on the Great Western is so lighted, as is also the corridor train on the South-Eastern. The Metropolitan Railway Company have given orders for some trains to be fitted with the installation as an experiment.

ON the 22nd inst. Colonel W. Langston Coke, C.E., an inspector under the Local Government Board, held an inquiry at the Salford Town Hall with reference to an application of the Corporation for power to borrow 13,000*l*. for electric-lighting purposes. The Town Clerk explained that 44,770*l*. had already been expended by the Corporation on the electric-lighting undertaking, and it was now proposed to construct a battery sub-station under the Regent Road Public Baths. A number of accumulators would be placed in the cellars of the baths and the electrical energy stored there, so as to provide for four hours' consumption of electric lighting at the present rate. The mains would be extended along the Regent Road district, and certain other improvements would be made in connection with the undertaking, so as to meet the public demand, now largely increasing. The inspector, after examining the plans, &c., said he should report to the Local Government Board in due course.

VARIETIES.

THE sanitary committee of the Croydon Town Council have recommended the extension of the borough isolation hospital at a cost of 12,000*l*.

A HANDSOME brass altar cross, the work of Messrs. Jones & Willis of Birmingham, has been presented to Balsall Street church, Knowle, by Mr. and Mrs. W. G. Blatch, of Arden Villa, Balsall Street.

MR. J. R. VEALL, architect, 84 Darlington Street, Wolverhampton, has been re-elected by the Bishop of Lichfield and Archdeaconry of Stafford to the appointment of diocesan surveyor for the district.

VOLUME LVII. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered. Price 12*s.* 6*d.*

OFFICE: 175 STRAND, LONDON, W.C.

KING'S LYNN was on Monday morning the scene of a fire which devastated a large portion of the business quarter of the town, and destroyed property which is variously valued at from 100,000*l.* to 150,000*l.*

THE Perth Architectural Association met on Wednesday evening, the 22nd inst., when Mr. John Anderson read a paper on "Dean of Guild Court Procedure" to a large assemblage of members, Mr. G. P. K. Young, A.R.I.B.A., the president, in the chair.

THE lighting committee of Dumfries Town Council have resolved to recommend that an apparatus to utilise the waste heat of public lamps to boil water should be fitted experimentally to two lamps, a halfpenny in the slot enabling a person to draw off a gallon of hot water.

THE Lancaster Town Council have unanimously approved the purchase, for 30,000*l.*, of the King's Arms Hotel and estate, the latter being intended for a covered produce market. Another 5,000*l.* was sanctioned for continuation of improvements in congested thoroughfares.

A GREEN satin portière worked in gold by Armenian widows who have been rendered destitute by the recent massacres is to be presented to the Queen by the members of the Women's Auxiliary of the Scottish Armenian Association. The design, representing the Tree of Life, a favourite subject in the East, was copied from the hangings in an old mosque.

THERE is no place in Wakefield Cathedral suitable for the erection of the proposed recumbent figure of the late Bishop Walsham How, and it is therefore suggested that the memorial to him should also include the additions to the building, which have long been necessary, and the cost of which will in all amount to some 20,000*l.* The son of the late Mr. J. L. Pearson, R.A., who designed the memorial, has been entrusted with its execution.

AT Newtown Stewart, county Tyrone, a fire broke out on Monday last in a shop in the main thoroughfare, and before it could be subdued a block of four-storey buildings, including the Maturin Arms Hotel, were almost gutted. There was a complete absence of fire-extinguishing apparatus in the town, and a strong south-easterly gale was blowing. The damage is estimated at over 6,000*l.*

THE new Lyric Theatre at Liverpool has been designed with taste, and with an attention to comfort of eye and body that cannot fail to please. The auditorium is arranged into pit with orchestral stalls (having a separate entrance), dress circle,

with a box at each side of the stage, and gallery. The entrances are large and the ventilation adequate. The proscenium is large enough to admit not only of the free movement of a large company of artistes, but also of the effective staging of any description of play from tragedy to pantomime. The general internal decoration is effective, white and gold being the dominant colours, and the electric light imparts an agreeable brightness.

CHICAGO Coliseum, said to be the largest building in the world under one roof, was destroyed by fire on Christmas Day. A manufacturers' exhibition was being held in it at the time, and the fire is believed to have been due to the crossing of the electric-light wires. All the visitors had left at the time of the outbreak, but 300 exhibitors and employes remained in the building, and of these three perished and forty were injured. The loss is estimated at 700,000 dols. (140,000*l.*).

THE extensive sawmill and general joinery establishment owned by the Cliff House Sawmills Company, Limited, West Hartlepool, was totally destroyed by a fire which broke out about eleven o'clock on December 23, and continued burning until six the next morning. The whole of the building, plant, machinery, tools and a large quantity of timber were destroyed. The damage is estimated at over 10,000*l.* About one hundred workmen are thrown out of employment.

A FIRE occurred at Weston-super-Mare on Monday evening, at the sea end of the pier connecting the mainland with Birnbeck Island, on which the pavilion, refreshment-rooms and concert-hall are erected. The fire appears to have originated in the children's bedroom of the pavilion through the overturning of a paraffin lamp. The flames rapidly spread, illuminating a large district and attracting thousands of spectators. With a strong wind from the west, all efforts to save the building proved ineffective, and the saving of the surroundings, including the switchback railway, was effected with difficulty. The damage is estimated at 4,000*l.* The property is well insured.

AT a meeting of the parishioners of St. Cuthbert's, Southport, the rector (Canon Denton Thompson) announced that, on the advice of experts and the Ecclesiastical Commissioners, it had been resolved to pull down St. Simon and St. Jude's mission church, opened four years ago at a cost of 6,000*l.* The reason for this step was the settlement in the foundations through the sandy soil, which could not be remedied except at great cost, and even then the appearance would be unsatisfactory, and the risk not entirely eliminated.

THE Wellington Hotel, the largest hostelry in Middlesbrough, was burned to the ground early in the morning of the 24th inst. The barmaid and servants were rescued by the firemen, and the landlord, Mr. D. Fitzgerald, was seen at the window. Despite all attempts at rescue he was suffocated, and his charred remains were afterwards recovered. Damage to the extent of a quarter of a million has been done. The Wellington was one of the best-known hostelries in the North of England.

A NEW Conservative club has just been opened at Dunscar. The premises are situate on Darwen Road, and are admirably adapted for their purpose. They comprise reading and card-rooms on the basement, and a capacious room already supplied with billiards and semi-billiards on the first floor. The land was generously given by Captain Slater, and the cost of the building is put down at 400/. A company has been formed, and already 750 shares at 10s. each have been taken up by members and friends. The members at present number 130, and since the informal opening about a fortnight ago the club has been exceedingly well patronised, being well appointed and suitably equipped. The premises were designed by Messrs. John Morris & Sons, architects, of Bolton.

THE new premises of the Carlisle and Cumberland Bank at Cockermouth form a striking and handsome elevation in Main Street. The design is a type of Renaissance adapted to present-day requirements, and the elevation is in warm tinted local stone. The roof is covered with green Westmoreland slates. The ground floor front is devoted to banking purposes, comprising the manager's office, telling-room, waiting and strong-rooms, &c. Above and behind an excellent house is planned for a manager's residence. The bank fittings are being executed in mahogany, while the flooring is in mosaics and wood-blocks. The architect is Mr. G. D. Oliver, of Carlisle.

THE hospital committee of the Liverpool Corporation have been considering the acquiring of land at Fazakerley for hospital purposes. The deputy surveyor (Mr. Turton) having reported on the subject, the hospital committee resolved that the Council be recommended, subject to the sanction of the Local Government Board being obtained to borrowing the money, to purchase for hospital purposes the fee simple, free from restrictions and incumbrances, except a ground rent of not exceeding 1/. per annum, of the estates known as the Harbreck House and Harbreck Farm, Fazakerley, comprising 113 acres or thereabouts, at the price of 300/. per acre, with an additional sum of 3,250/. for all the buildings and timber on the two

estates, making the total price approximately 37,150/, subject to a contract to be prepared by the town clerk, and that an application be made to the Local Government Board for their sanction to borrowing the sum of not exceeding 38,000/. for the purchase of the land for hospital purposes.

THE Scotia Music Hall, in Stockwell Street, Glasgow, has undergone the process of transformation into an up-to-date theatre, to be known henceforth as the Métropole. It is now practically a new house. Only the walls and roof of the old music hall are left. The interior has been entirely rearranged, and as all the alterations have been in the direction of improvement, the theatre in its present state may be considered one of the handsomest and best-appointed in the city. The building provides accommodation for about 2,300. The exit arrangements are ample. The electric-light installation is complete, and all parts of the house, including the dressing-rooms, are warmed by hot-water pipes. Excellent taste has been shown in the decoration, and the lighting, ventilating and sanitary arrangements are in approved style. The stage has been brought out about 20 feet, and now measures 42 feet by 80 feet, with a gradient of one in sixteen.

AT a recent meeting of the Town Council plans were submitted from Sir William Arrol of a proposed new bridge over the Tyne at Haddington. The bridge, which is a handsome structure, is estimated to cost 7,500/., exclusive of approaches. The western approach would be on the site of the present Flesh Market at the foot of Market Street, and the other on the new road through the land belonging to Messrs. Montgomerie & Co., Limited, of the Bernaline Mills. In addition to land offered by the company, they offer to subscribe a sum of 500/. towards the cost. The proposal was favourably received, and it was agreed to approach Lord Wemyss, who is a largely interested proprietor, on the subject.

THE new Refuse Despatch Works erected by the Glasgow Corporation at Haghill, Parkhead, were opened on the 21st inst. The ground, selected as being the most suitable in the locality, extends to 15,192 square yards. Of that 11,012 yards are occupied by the works, leaving 4,180 yards which can be utilised for other purposes. The cost of ground, buildings, machinery and railways, and including the formation of a new street, amounts to about 2,000/. Entering from the street by the north gateway, carts pass over an elevated roadway to the tipping floor, where are tanks, shoots and pails for the separation of the refuse. The process of separating and mixing is carried out on this level. Domestic refuse and dry sweepings

are screened in riddles, the finer matter passing into mixing machines with revolving blades, and falling direct into railway waggons underneath. The rougher material which cannot pass through the screen is forced by the motion of the riddle on to an endless carrier, which conveys it in the direction of the furnaces. While passing over the carrier all articles of value, such as iron, tin and bones, are picked off and utilised to the best advantage. In the slop tanks is the residuum of soft sweepings from paved streets, which, when firm, is conveyed to railway waggons, and goes to enhance the quality of the prepared manure. This manure is largely used by agriculturists over a wide area of Scotland. There are five furnaces for the cremating process, each with a fire-grate area of 56 square feet. Steam is generated by the heat from the furnaces not only for driving the machinery for treating the refuse, but also for the lighting of the whole station by electricity. It is eighteen years since the Corporation decided to have refuse works, and there are now four such works in the city. Their total cost has been 126,000*l*.

ROYAL CAMBRIDGE THEATRE OF VARIETIES.

THE new music-hall in Commercial Street, which, Phoenix-like, has arisen from the ashes of its predecessor which a few months since was destroyed by fire, is an instance of the immense strides which are being made in the direction of increased comfort and elegance provided for the patrons—the number of whom is constantly increasing—of such establishments. The advance which has been made during the last decade in the aspect of the “halls” and in the tone of the entertainment which prevails, is astonishing and very gratifying. The building in question, which will accommodate some two thousand spectators, is designed in the Moorish style, is lofty, well ventilated, and tastefully decorated and furnished. The stage, which is of adequate dimensions, is provided with an iron curtain and a water curtain, and the lighting throughout is by electricity.

COLLINS'S, ISLINGTON.

THIS is another music-hall or “theatre of varieties,” as it is now the mode to call such places of entertainment, which, yielding to the necessity for expansion and luxury which is a sign of the times, has been demolished and reconstructed from designs by Mr. E. A. Woodrow. The theatre is in all respects

admirably fitted up and comfortably and even luxuriously furnished. The Louis Quatorze style of decoration has been adopted for the auditorium, the prominent tints being old gold, blue and terra-cotta; the general colouring is carried out in delicate tints, and the blue draperies and plush-covered seats (in old gold) present a warm and rich appearance. The ground-floor is divided into fauteuils, stalls and pit-stalls, with the convenient tilt-up seats, and a handsome pile carpet covers the floor, which is formed of wood-blocks, the result being comfort and solidity and the requisite absence of noise. The stage has been nearly doubled in size and is fitted with tableaux and fireproof curtains and all modern requirements; and from all parts of the house a good view of the performance is given. Hot-water radiators have been provided for making the auditorium and entrance passages comfortable. There is seating accommodation for nearly 1,800, the gallery providing about one-third of this.

PROPOSED ELECTRIC RAILWAY.

A BILL to incorporate the New Cross and Waterloo Railway Company has been deposited in the Private Bill Office. The proposed company seek power to construct an underground electric railway commencing at a point in Old Kent Road, near the bridge carrying the London, Brighton and South Coast Railway over that road, and terminating under Waterloo Road near the point where the South-Eastern Railway crosses that thoroughfare. The capital proposed to be created by the company is given in the Bill at 975,000*l*., which is proposed to be divided into 97,500 shares of 10*l*. each, but with power to subsequently divide these shares into preferred half-shares and deferred half-shares. Upon this capital borrowing powers are

proposed to be exercised by the creation of debenture stock to an amount not exceeding 325,000*l.* The first directors of the company, who are also given as the promoters, are Mr. James Heath, M.P., Mr. Robert Arthur Read and Mr. Thomas S. Soden. The Bill contains provisions prohibiting the construction of ventilators or other openings in any road or footway, and also the exhibition of advertisements upon any part of the works. During the period of construction power is sought to pay interest out of capital to an amount not exceeding 80,000*l.*, and power is sought to enter into working agreements with the London and South-Western Railway, the Waterloo and City Railway and the Baker Street and Waterloo Railway Companies.

BOROUGH ROAD POLYTECHNIC.

THE sixth annual conversazione was held on Wednesday night, the whole building being thrown open to students and friends. Besides a varied musical programme there were numerous exhibitions, including some clever games of billiards. There are over 3,000 members of the Institute, nearly all of whom attend the classes. The technical section is of course the most popular, and students must be actually engaged during the day upon the work in which they wish to perfect themselves in the theoretical and practical classes. During the past six years the instruction has become so popular that the building is now found to be too small. Five new workshops were added, and it has been found necessary to erect still another five rooms, which will be opened next March. About 150 classes are held daily. There are no less than 650 working students in these departments, no amateurs being admitted.

ALEXANDRA THEATRE.

THE residents of the north of London should be grateful to Mr. F. W. Purcell, the proprietor, and Mr. Frank Matcham, the architect, for putting up in their midst a theatre which for comfort and elegance will vie with any of the West End houses. The Alexandra is admirably situated in the Stoke Newington Road, to which it has a frontage of 120 feet. The elevation, which is attractively designed on Italian lines, is carried out in dark red brick with stone enrichments. The two ends are carried up with pediments, filled in with rich carving,

under which is a deep cornice with entablature with gold letters, bearing the words "Alexandra Theatre and Opera House."

The centre portion is kept lower and divided up with columns between the windows, a large stone oriel window projecting from the crush-room, the whole being crowned at the top with bold balusters divided with pedestals containing flambeaux. A feature in the exterior are the two large handsome ventilating roofs at each end, over the gallery and stage; indeed, the ventilation has been one of the matters that have received the architect's principal consideration.

Over the pavement, in the centre of the façade, a large handsome glass and iron verandah is being erected to shield the dress-circle and stall patrons from inclement weather. The pit and gallery entrance is similarly favoured.

The theatre is particularly well provided with handsome vestibules, crush-rooms and foyers, &c., the walls and staircases being of marble. The ceilings are artistically modelled, and the floors are covered with thick velvet pile carpets, while mirrors and brilliant illuminations by the electric light produce a striking *ensemble*. The entrance doors are of polished wood fitted with copper handles and plates, and coloured glasses are introduced into the windows and doors in a very effective manner.

Of the interior, which is approached through a handsome vestibule, an innovation of Mr. Matcham's is a noteworthy feature. It consists in raising the boxes, which are usually situated at the back of the dress-circle, and forming thereof a separate tier, which is exceedingly effective in appearance, and gives space for a handsome corridor at the back of the dress-circle, to which it gives ample and convenient access. The decorations are very rich and the lines elegant. The style is a free adaptation of Elizabethan, the colouring cream and gold, relieved with artistic paintings on a light blue ground, with background, upholsteries and draperies in rich copper-bronze velvet.

Each part of the house has a separate entrance and an additional exit. The staircases and corridors are all fireproof, and are excellently arranged for every entrance and egress, all doors being fitted with alarm exit bolts of the best description. Large and well-ventilated saloons and retiring-rooms, heated with hot water, are provided for each part of the house, and the comfort and safety of the audience have had every consideration.

Hydrants are placed in the most convenient positions, and

there is an asbestos and water curtain, by Merryweather, provided to the proscenium, forming a fireproof division between the stage and the auditorium, and embellished with a picturesque view of Sandringham.

The galleries are constructed on the cantilever principle, and are of steel and concrete. The house accommodates about 3,000, the gallery holding 900 and the pit 1,000. On each side of the stage are two boxes, handsome and spacious, surmounted by immense domes. The stage itself is well adapted for scenery of any ordinary size. It is 50 feet deep, 60 feet wide, and the height to the "grid" is 60 feet.

NEW CHURCHES IN GLASGOW.

THE memorial-stone of the new Chalmers Free Church, which is being erected at the junction of Cavendish Street and Pollokshaws Road, has been laid. The new church will cost 6,500*l.* and the site 3,000*l.*, making a total of 9,500*l.* The new church fronts Pollokshaws Road, with classrooms and hall in a separate building at the corner of Cavendish Street. There are side galleries over the aisles, also an end gallery, the seated accommodation being for 840. In the front the central entrance is protected by a circular portico, the pillars of which are 22 feet in height. The interior is arranged with the area pews all following a radius from the pulpit. The platform of pulpit provides space for an organ. The nave is roofed with a level ceiling divided into panels. The contracts for the church and hall amount to 6,000*l.* The architects are Messrs. H. & D. Barclay.

The foundation-stone of St. Kenneth Church, a new church which is being erected at the corner of Katherine Drive and Hutton Drive, Holmfauldhead, Govan, has also been laid. This is the third church to be erected as part of the new scheme of church extension inaugurated by the Rev. Dr. John Macleod and the kirk-session of Govan parish. It will accommodate 800 people, and there will be a hall constructed to seat 300, as well as smaller halls, committee-rooms, vestry, &c. The plan, which is according to the model designed by the architect, Mr. Macgregor Chalmers, for this series of churches, comprises a large nave with one side aisle, in which is the only gallery; a large chancel for the choir and communion table, a side chapel and an organ chamber. The

interior will be finished in stone, the roofs will be of open dressed timber and the halls will be finished in red-pressed bricks.

The new Ferguson Memorial E.U. church, situated in Palmero Street, Springburn, was opened recently. This church is in the Gothic style of architecture, accommodation being provided for 350 sitters. The architect was Mr. J. M'Kellar.

PROPOSED MUNICIPALITIES FOR LONDON.

THE conference of representatives of the London parishes desirous of improving the present system of local government by vestries have prepared a tabular statement showing, side by side, the population and rateable value of twenty-five of the parishes in Schedule A to the Metropolis Local Management Act, 1855, as amended, of the thirty-three places designated by the Registrar-General as "great towns" and of the other large towns classified as county boroughs by the Act of 1888. The development of the area to which the Metropolis Management Acts apply during the past thirty years has proceeded by such strides that its population is now equal to that of Portugal, greater than that of either Sweden, Norway or Switzerland, and is twice that of Denmark or Greece, while "Greater London" nearly approaches in its number of inhabitants the whole of Australasia, the Dominion of Canada or the kingdom of Belgium, "one of the most densely-peopled countries of the world;" and some of the larger "parishes" are far in excess of many of the "great towns" in the provinces. The comparison, it is submitted, lends valuable confirmation and support to the memorial to be presented to the Government praying for an improvement of the present system. From the comparison it appears that the only three "great towns" in England not surpassed either in population or rateable value by one or other of the vestry-governed parishes in the Metropolis are Liverpool, Manchester and Birmingham. Some of the parishes contain more inhabitants than some of the English counties. Thus Battersea, with a vestry as its governing body, is more populous than the whole county of Buckingham, in which a county council and three municipal corporations exercise jurisdiction; and Camberwell has under the local government of its vestry more inhabitants than all Oxfordshire, in which a county council, five municipal corporations and numerous district and parish councils administer the local affairs.

THE GREAT FIRE.

If the roofs of some of the houses burnt down in the City had been covered with copper instead of zinc (which blazes), or lead (which melts), the fire would have been arrested at these buildings, as the flames could not have escaped through the roof.

Full particulars for covering Roofs with Copper in the best manner will be forwarded on application to

**EWART & SON, 346 - 350 EUSTON ROAD,
LONDON, N.W.**

THE CITY AND THE FIRE.

THE *City Press* says:—The members of the finance and improvement committee will be called together after the Christmas holidays to resume the consideration of the important question of improving the area which was laid waste by the great fire. The Commission of Sewers will cease to exist on the 10th of next month, and the work of the committee will then be transferred to the improvements committee of the new Public Health Department, so that the continuity of the work will be in no way impaired. Three schemes for great street improvements were laid a few days ago before the improvements committee of the London County Council, the members of which very cordially received the City deputation. No decision was arrived at, and some time must elapse before definite plans are drawn up, as some of the questions involved are very intricate and require grave consideration. The members of the improvements committee of the County Council are, however, in perfect accord with the citizens as to the desirability of effecting a great metropolitan improvement in Cripplegate, although, as is only natural, considerable difference of opinion exists on the question as to how this improvement can be carried out. A new street running through the fire area will not improve the locality if steps are not also taken to prevent owners of property from building on old lines. This is recognised as the crux of the whole question. To the cost of making a new street must be added the enormous expense of compensating owners beyond the area of the proposed street.

THE PROPOSED GOVERNMENT OFFICES.

THE following evidence was given by Mr. Waterhouse, R.A., before the Select Committee on Government Offices (Appropriation of Sites):—

Chairman: You are a Royal Academician, and you are past president of the Institute of British Architects?—Yes.

You are in sympathy with the plan which has been produced on behalf of the Institute by Mr. Anderson, and generally you support the view which he maintains?—Yes, I may say entirely.

You are particularly anxious that these buildings should be kept down to four storeys in height?—I am so in the case of buildings on the Carrington House site, because it comes so immediately opposite the Horse Guards and the old Admiralty

buildings, and in the case of the Great George Street site for the reason assigned by Mr. Anderson, that buildings on it would so better balance the Treasury buildings. In that connection perhaps I may say that one reason why it seems to me better that we should keep the Great George Street buildings absolutely rectangular, and not indulge in canted angles or a sloping front, is that we should lose a great deal of the dignity of the building as seen from Parliament Street if it slopes away from the general alignment of the Treasury Buildings and the Home Office by following a canted diagonal line, or if the corner is cut off either by rounding it or by setting it in, as I understood was proposed.

In fact, you entirely sympathise with the views expressed by Mr. Anderson, that it should be parallel and rectangular?—Yes, both as regards the increased space thus gained and as regards its architectural effect and dignity.

Beyond that, you also would like to see the proposal carried out that the Government offices should be concentrated on the Great George Street site, and that that rectangular line should be carried right up to the park along Great George Street?—Yes.

Then with regard to widening at the neck of Whitehall, you also think that it is essential that the street should be widened, and in your opinion the west side should be thrown back, as shown in the plan which has been deposited on behalf of the Institute?—I think so. From an architectural point of view I think it is most important that the neck of Whitehall should be made wider than it is at present, and that the west side is decidedly the best side on which to effect the widening. In fact, the axial line, about which so much has been said, and the advantages of which have been so much insisted upon, can only be maintained by effecting a widening on the west side of the street.

You attach considerable importance in looking up Whitehall to see the portico and the dome of the National Gallery?—Yes, I do; yet I think it is important that both the dome and the portico of the National Gallery should not coincide with the column.

In that respect you differ?—No, I do not differ. If you look at the column and the portico of the National Gallery, and get them exactly in line, the effect is almost ludicrous, because the dome combines with the column to make quite a ridiculous figure. The one great advantage of Mr. Anderson's plan is, in my opinion, that though he maintains the symmetry of the approaches to Trafalgar Square, he interposes double

lines of trees on the axial line between the two roadways, so those who approach Trafalgar Square from Whitehall will have to do so either to the east or west of that line, and therefore see the portico of the National Gallery clear of the column. Yet there is all the dignity and stateliness of a symmetrical arrangement about this scheme.

You would have no designs upon the Horse Guards; that is too valuable?—I think it is. I believe Mr. Anderson has indicated against the flank of the Horse Guards the site for a group of sculpture, perhaps on a lofty architectural base, as a fitting termination to the western roadway. It strikes me, also, that approaching Trafalgar Square along the eastern roadway there would need to be a very careful treatment of the projecting corner beyond the site for the War Office shown upon our plan, since this corner would form a conspicuous feature in the view. With these two exceptions it seems to me that there are no objections to the plan at all, and that these might be met by a careful study of the requirements of the case.

Mr. Whitmore: If you could ignore money altogether, would you widen at the same time the eastern side of Charing Cross?—No; I would like to see some of those buildings rebuilt, but I do not think I should be disposed to alter the alignment.

Mr. Herbert Gladstone: Might it not be desirable to take down the Paymaster-General's office, so as to open up, perhaps under some new treatment and detail, the Horse Guards?—That is part of the scheme; we do propose it.

I understood there was to be some special treatment of the Paymaster-General's office?—No, it comes away, and Mr. Anderson has suggested its being placed in front of the War Office quadrangle, as being there conveniently situated both for the War Office and the Admiralty. Then he also proposes, and I think it is a strong point, a large opening into the park, so as to see more of the park from Whitehall Place.

Chairman: On to the parade, you mean?—On to the north-east angle of the parade.

Mr. Disraeli: Have not you got a road really too large for all requirements just opposite the proposed new War Office?—Of course, it is the widest part of Whitehall Place.

Suppose the committee were to recommend this, do not you think they would be considered to be wasting room?—It is 200 feet wide there, but it is only just at one place.

Mr. Herbert Gladstone: It is not a street, it is more a place—an open place?—Yes. It occurs just at the southern end of the wide avenue, the prolongation of Trafalgar Square south-

wards, and would be needed for easily turning into the western roadway of that avenue.

Chairman: I believe, apart from this, you attach great importance to the street to the south of the War Office opening into Whitehall with its centre immediately opposite the Horse Guards?—Yes. The view of the Horse Guards from thence is particularly interesting, and the view through the arches into the park is exceptionally charming.

And then you attach importance also to this, that in this Horse Guards Avenue there should be some treatment of the northern end of the banqueting-house?—It appears that the northern end of the banqueting-house is in part, if not wholly modern. It is treated in a manner quite unworthy of the west and east fronts of the banqueting-house, and as it would now be more conspicuous than ever, it seems desirable that it should be finished in a manner worthy of the rest of the building.

In all other respects the evidence you would tender would be to confirm that which has been put forward by Mr. Anderson on behalf of the Institute?—Yes.

There are no points in his evidence on which you yourself hold a different opinion which you would desire to record on the present occasion?—No.

Mr. Whitmore: Do you object strongly to those architectural plans?—Yes. I think the sites as first proposed would have been insufficient in area, and ungainly in contour. The Carrington House site is not in itself large enough for a dignified War Office.

If money considerations make the carrying out of your design impossible, you would prefer that nothing should be done rather than that design should be carried out?—I suppose it is better to accept a small good than none at all.

You would esteem this to be a small one?—I should esteem it so from an architect's point of view.

Mr. Disraeli: May I ask you as to the question of the rectangle at the bottom of Parliament Street; it is your strong opinion that it should be a right angle there?—Yes, for the reasons I have assigned. The building, I think, will lose in dignity if it is not kept rectangular.

And nothing would be gained, in your opinion, by making it anything but a right angle?—I think it will be a loss. Perhaps I may be allowed to say that though I sympathise with those who care for the view of Westminster Abbey from the end of Parliament Street, I do not think the view would be better further north than it is at present, when seen from the end of the street.

Have you looked at the view of the Abbey lately since the leaves have been out?—Yes.

You do not see very much of the Abbey, do you?—You do not see much of it, but what you do see is well worth seeing.

You see so little that it is not worth while, in your opinion, going out of your way to alter the alignment of the buildings in order to get a view?—No. I endeavoured to say just now that I consider that as we get a view of the Abbey, and a very charming view it is, from the end of Parliament Street, it is not worth while spoiling a great public building to secure the view a little sooner.

What is your objection to the building on the Downing Street site shown in the plan on the wall?—It does not give us a very large amount of extension, and it shuts out more of the view of the Foreign Office than is altogether desirable.

Do you think that some sentiment about the First Lord's house should be considered?—Yes, I think it would be desirable to keep the house, and that a more pleasing result would be obtained by keeping a little garden space at the western end of the house than by building all over the site, but I have no very strong feeling about that.

You would do away with the other houses. As Mr. Anderson said, you would say that they are of no architectural value?—They are entirely unworthy of the site.

Chairman: I think there was some evidence which you wished to put in on behalf of your Institute; the views of the Institute?—The Royal Institute of British Architects consider it desirable that a definite plan should be considered for the appropriation of such of the land now available for Government offices as may be necessary for their proper development in accordance with the appropriate architectural scheme. By this means the best will be done that now can be done to redeem the omissions of the past and to secure an opportunity for the architectural treatment of these important buildings commensurate with their importance. That I understood to be what the Institute wished us to press if we were allowed to appear before you.

Professor George Aitchison gave the following evidence:—

Chairman: You are an Associate of the Royal Academy and professor of architecture to the Royal Academy?—I am.

You are also the president of the Royal Institute of British Architects?—Yes.

I understand that the proposal which has been carefully explained to the committee by Mr. Anderson is the proposal

which the Institute wished to be brought to the attention of the Government?—It is.

In those matters you support the evidence which was given by Mr. Anderson?—I do.

With regard to the proposal put forward by the Office of Works on the wall there, do you share with both Mr. Anderson and Mr. Waterhouse their opinions with regard to the shape of the building in Great George Street and Parliament Street?—Undoubtedly.

You prefer the parallel to any other formation at the corner?—Very much. It would make a very much finer group if the two wings were the same height and nearly the same length, so that the tall Foreign Office should make the centre of two very fine wings; and that Treasury façade that was built by Sir Charles Barry was looked upon at the time that it was built as very admirable.

You also hold the view that it is undesirable to erect further buildings at the end of Downing Street and on the Horse Guards Parade, and you would prefer with your colleagues that any additional space that would be required for Government offices should, if possible, be acquired on the Great George Street site, so that the whole of the offices might be grouped upon that site?—Yes, certainly; and I think that if on account of its great historical interest the First Lord's house is to be retained, it should be in a position where it can be seen by people who come, not only to London, but also to England, to see such things.

Do you share with your colleagues the opinion with regard to the prolongation of the Mall into Charing Cross, that the opening of the Mall into Charing Cross should be made more to the north than is shown in the Government plan?—I think so, because there are two points about it; one is that you see down the Strand better, and the other is that it is a most charming relief after passing through the dusty streets of London to look on to trees and grass.

I take it that you also have approached this matter with your colleagues entirely from an architectural and æsthetic point of view, and that you have not considered at all the question of cost?—Not in the slightest; and if I may be allowed to say something without being asked, it appears to me that where you have an imperial matter like this to deal with the question of cost should not enter into it. For my own part, I would rather see 1s. a cwt. put upon sugar than that we should have one of the finest parts of London spoiled, and that England should not show as well as other countries in Europe

its desire to dignify itself in its Metropolis by having the finest buildings it can get, and having them arranged in the best possible way. Of course, there are a few fine sites in Europe that are such by nature that we have not got them; but Sir Robert Peel said of the National Gallery that it was on the finest site in Europe. I do not think it is equal to the Acropolis at Athens, but still it is a fine site. The Piazza at Venice is fine, and there are other fine sites, no doubt; and I think we ought not to have this spoilt.

The view of the Institute, therefore, is that the opportunity should be taken, while the Government are seriously thinking of sites for Government offices, of doing something to improve the unfortunate alignment of Whitehall, and to make the approach to it, at all events, worthy of the Houses of Parliament at the one end and Trafalgar Square at the other?—Yes.

Mr. Molloy: I suppose you hold the same view with regard to the setting back of the Great George Street site?—Yes; you see if you stand in these gardens or even on the further side of the street by Richmond Terrace you there see the whole three.

You see two now?—You see two now, but the third one would add importance to them and form a group as well.

Looking at it from the New Palace Yard or from Westminster Abbey, that is, in an opposite direction, do you think they would have a bad effect architecturally or artistically?—You would see from the New Palace Yard very little indeed; you could hardly see the grouping at all.

Take it from Westminster Abbey, the garden ground round it, looking at it from that point of view, if the Great George Street site were set back to the line I have pointed out to the first witness there would be nothing inartistic then?—Whatever you do to it will, of course, more or less spoil it if these two buildings, that form as it were the wings of the Home Office, are not in a line. If you look from any point where you can only see the Great George Street site it would not matter, but directly you get near the Home Office the best effect of the grouping is gone if the two wings are not in a line.

For the grouping purposes you have to go into Parliament Street?—Yes.

If you are not in Parliament Street the alignment effect is of no value?—No, you cannot see it.

From the several other points of view the setting back would have really no inartistic effect?—No, I do not know that it would. The whole point of the thing is to get the Home Office as a centre, with the lower buildings on either side, and

if these are put at an angle, or one is set back very far from the line of the other, of course you will spoil the effect.

From the Parliament Street view?—Yes.

But not from anywhere else; that was the point?—I do not know that you would.

Is there any necessity for making the new building a wing of the Home Office?—Only an æsthetic necessity; that is all.

Speaking from an architectural point of view?—Yes.

There is no necessity for making it a wing of the Home Office?—No, but you would lose the possibility of that effect if you did not.

If you do not do it you will not have the wing?—No.

There is no necessity for doing that?—Only the necessity of making a very admirable group, which you would not otherwise have. There are many points of view from houses and elsewhere; but I merely took it from the street, because that is where most people see it from.

From the Parliament Street point of view you desire the alignment, but you do not see any evil from any other point of view?—Well, you see, if you want to get a good effect you take it from the place where the thing is most effective, and if you prevent that being taken you more or less spoil the whole thing.

From an artistic or æsthetic point of view, assuming the buildings were worthy buildings, would not a broken line be more effective looking from Westminster Abbey than what you may call a straight line and right angles?—There you have an opportunity of doing a good thing; but I admit that a man of genius is able to produce fine effects in untoward circumstances; you know what a charming effect the National Gallery has, coming up from Pall Mall. It is one of the most delightful pieces of architectural composition, perhaps, in the world.

Your opposition to the setting-back of the new buildings is based solely on your desire to group the Treasury, the Home Office and the new buildings together?—Yes.

That is the groundwork of your opposition?—That is so.

Mr. Disraeli: May I take it that it would be fatal to the dignity of the scheme of grouping if a corner at the bottom of Parliament Street was in any way tampered with?—Unless you get it pretty nearly the same, not very strongly discernible by the ordinary person's eye that one is much bigger than the other, you lose the effect.

It would diminish the size of the building to the eye?—Yes.

Therefore, in your opinion, it would lose its dignity and importance if it were anything else but a right angle?—Yes.

May I take you to Charing Cross end; do you attach the same importance to the line drawn from the dome of the National Gallery to the monument, and straight down to the corner of the place?—Supposing you stand under the portico of the National Gallery now, to a great extent the effect of that fine street is missed.

But coming up the street, do you consider the National Gallery buildings are of great artistic merit?—No doubt.

And therefore, if possible, they should get the view?—Yes, certainly.

You do not think that the appearance of the street would be improved by enlarging it on the eastern side, supposing questions of finance would not allow the committee to recommend the other?—It looks very pretty coming up, if you come up on the east side, but you only see the end of the National Gallery. Formerly there was a street at the back, and one of the difficulties Wilkins had to contend with, which he did in the most admirable way, was to make two entrances from the National Gallery into that street, and the labour he bestowed on doing this to make them admirable is worthy of all praise, and they are certainly delightful things. But still, when you have got a large building like that, to have your principal street coming right on one side so that you only see the end of it, seems to me rather a blunder.

Still, Trafalgar Square is a very broad place?—Yes.

Which modifies the fact of the street coming not exactly in the centre?—You get none of the effect in looking down from the National Gallery, whether you go under the portico or in front of it, if you keep it out of the line.

Mr. Whitmore: Supposing it were found impracticable to widen Charing Cross on the western side, or on the eastern side, would you still attach importance to the difference in your plan for the extension of the Mall to Charing Cross and the way it goes there?—What I said before was that it is always a very agreeable thing to look down a long street, and it is still more agreeable to look up a long street and see trees.

Then looking at that point of view from the other side, supposing you are coming from Buckingham Palace towards Charing Cross, do not you think it would still be an improvement to get the point of view that you would get under your line and the extension of the Mall rather than the view that would be obtained by that extension?—We thought undoubtedly it would.

And that would be the case even if your suggested widening of the neck of Charing Cross were not carried out?—

Yes, certainly; but still the most important thing, of course, we think, is the widening of Whitehall.

What I rather wanted to gather from you was this. Supposing your scheme in its integrity could not be carried out, what portions of it would you abandon with the least reluctance?—I think I would abandon that with the least.

Which?—The line of bringing the Mall into Charing Cross.

That alteration of the line?—Yes; but I think that getting the alignment of the street is important.

Still, if you could not get the widening of the street, you would prefer your plan of the extension of the Mall to that?—Yes. For a country like this, when grouping all these great buildings, in which all the government not only of the United Kingdom but of our dependencies takes place, certainly the least possible consideration that can be given by the Government to cost should be given.

The committee agreed to the following report:—

In continuation of our report dated July 23, 1896, we beg leave to state that we have taken further evidence upon the plans laid before the committee last year.

Having regard to certain criticisms made from an architectural point of view upon those plans, we have thought it well to examine representatives of the Council of the Royal Institute of British Architects and other qualified members of the profession.

Various alternative plans have been submitted to us by these gentlemen, but whilst we have availed ourselves of some of their suggestions, we have felt unable, owing partly to the enormous cost involved, and partly to other considerations, to recommend their schemes generally for acceptance.

Upon a review of the whole evidence, we have arrived at the following conclusions:—

We are of opinion that the new public offices on the Parliament Street or Great George Street site should be erected mainly on the lines of plan No. 1 in the appendix to the report of last year, with a frontage in a line with the frontage of the Home Office and parallel to the east side of Parliament Street; but we recommend that the south-eastern corner should be square and not rounded. The land between this new frontage and the present west side of Parliament Street would, if this plan were adopted, become part of the public street, and in our opinion there is no need to make special provision for separating the traffic at this point.

PRICE LIST AND ESTIMATES ON APPLICATION.

It appears to us reasonable, in view of the great metropolitan improvement here to be carried out at the cost of the Government, that the London County Council should be requested to consider whether they should not put into operation the powers possessed by them under the Public Offices (Westminster) Site Act of 1896, and contribute a share of the total value of the land, which under this scheme would become part of the public street.

We recommend the appropriation of this site for the Board of Trade, the Education Department, and the extension of the Local Government Board.

As regards the Whitehall site, having considered the alternative schemes for the War Office which have been placed before us this year, we adhere to the recommendation made in our interim report, being satisfied that a building satisfactory in appearance and accommodation can be erected on that site within its present boundary lines, and we are of opinion that the details as to the arrangements of buildings, courts, &c., should be entrusted to the discretion of the Office of Works, in conjunction with the architect selected. We think that a subway should ultimately be formed under the street between the War Office and the Admiralty.

Schemes have been submitted to the committee by the Royal Institute of British Architects and by Colonel Edis for a widening of Charing Cross and of the northern part of Whitehall; but we cannot recommend that the taxpayers should be asked to bear the cost of this metropolitan improvement, which, if undertaken, comes more properly within the duty of the local authorities.

We, however, strongly advise that the Mall should be opened into Charing Cross on the north side of Messrs. Drummond's bank.

We do not contemplate the passage of any other than light traffic through the Mall, and are satisfied that the skill and experience of the police would supply satisfactory means of overcoming any difficulties of traffic which might to some extent follow such opening.

We think that no decision should be arrived at as to building on the triangular site in Spring Gardens until the houses standing there have been removed, and the ultimate requirements of the Admiralty considered.

We recommend that Nos. 11 and 12 Downing Street, occupied respectively as a residence for the Chancellor of the Exchequer and as an office for the Patronage Secretary to the Treasury, should be removed as unworthy of the site they

occupy, but we are of opinion that the principal block of No. 10, the historic residence of the First Lord of the Treasury, for reasons of practical necessity and on account of its associations, should be retained, the Downing Street front being masked by erecting a new building with a good architectural façade and the Park front being cased in stone, so as to harmonise with the north and west fronts of the old Treasury buildings, and the garden ground being enclosed with a screen or railing of handsome design.

We do not recommend any further building on this site. We are of opinion that whatever other office accommodation is required, which cannot be conveniently found in existing Government buildings, should be provided for by an extension of the Great George Street site in the direction of Delahay Street and St. James's Park, in which case readjustment of the arrangement at present shown in the plan of the Office of Works might have to be made.

PREVENTION OF THE SPREAD OF FIRE.

IN the *Times* of Tuesday Mr. N. S. Joseph, architect, discusses the question, Can any methods of construction be enforced to prevent the disastrous spread of fire to neighbouring buildings? The prevention of an occasional conflagration is, he says, impossible. Even the destruction of a large building, filled with valuable goods, is an evil that must be occasionally faced. Insurance companies are established to meet such evils. It would be a far greater evil if such building restrictions were uniformly imposed, in the way of so-called fireproof construction, as would be not only a restraint of fire, but also a restraint of trade and commerce, too onerous and too vexatious to be borne by business men. Yet prudence and public interest should impose reasonable restrictions.

The proper subject for inquiry, then, is not how can we prevent a large warehouse from being burnt down, but how can we prevent such an evil becoming a great calamity by its rapid spread, as in the case of the Cripplegate fire, when buildings covering 17 acres—chiefly modern edifices—were reduced to ruins within about eight hours? And be it remembered that, great as that calamity was, it was only due to fortuitous circumstances, such as the absence of wind, or the presence here and there of specially high party walls, or the existence here and there of an open space, that the calamity

The COWL has proved a perfect cure in the case of most troublesome chimneys.

TESTIMONIALS.

"I consider your cowl far above any other cowl in the market, and have much pleasure in recommending it to anyone suffering from smoky chimneys."

"Forward the 10-inch cowl on order at once; we have fixed the others and find they give every satisfaction."

"Your cowl has proved a complete success, no matter which way the wind blows. Please forward me another one at once."

was not tenfold as great as it was, and that the range of devastation did not spread from Barbican on the north to Gresham Street on the south, from Moorgate Street on the east to Aldersgate Street on the west; for the entire area bounded by those comparatively broad thoroughfares consists mainly of a maze of narrow streets and courts, closely packed with warehouses, factories, offices and shops, save where a church or churchyard intervenes to afford a small open space, or where the Guildhall and a few of the great homes of the ancient City companies hold their own, a contrast in point of space between the past and the present.

What, then, were the causes of the rapid spread of the Cripplegate fire? And what measures should be taken to prevent such or a far greater calamity in the future?

The causes are clear enough to those who witnessed the fire and who have since wandered among the ruins. The flames leaped across the narrow streets, igniting the windows and doors of the opposite buildings, which were thus set ablaze. The flames emerged from the back windows, crossed the narrow lighting areas or well holes common to several warehouses, and so involved all those buildings in the holocaust. The flames, in some cases, mounted over the low parapets of high party walls and appeared to be sucked downwards on to the adjoining roofs, setting on fire the neighbouring warehouses, which thus burnt from the top downwards. Contiguous lead flats, covering outbuildings erected on spaces which had been formerly backyards, and divided only by a parapet only 15 inches high, the minimum required by the Building Act, became involved in one general blaze, the low parapet being unavailing to check the spread of fire, so that every warehouse sharing in these lead flats shared also in the general ruin. The danger was greater and the effect more rapid in those instances where the flat was pierced with wooden skylights. Countless burning embers were hurled upwards through the air from the flaming piles, then driven horizontally or diagonally on to contiguous roofs and lead flats, where they soon burnt their way through the metal or slating, setting alight the roof timbers and upper floors, which again burnt downwards. The match-lined walls of the warehouses not only added fuel to the flame, but the hollow space behind the match-lining—a space usually more or less continuous from top to bottom of a building—lent draught and suction to the fire, so that in a few minutes a tall warehouse became a bonfire, and ultimately a pile of bricks and ashes, but meantime making a bonfire of its neighbour similarly constructed.

An inspection of the ruins is most instructive to the practised professional eye. It shows that all the party-wall provisions of the Building Act are insufficient, by themselves, to check the spread of fire. Huge party walls, some of them absolutely complete from bottom to top, and even surmounted by their chimney-pots, were left standing with great gaps between them, grim monuments of their own futility. Only in cases where a party wall, or the parapet of such wall, had been carried up much higher than a burnt building has the work of ruin been checked.

What measures can be adopted to prevent in the future so widespread a calamity as the Cripplegate fire, or perhaps a calamity much worse? Legislation can do but little. The London Building Act of 1894—in many respects a great improvement on the Act of 1855—is already sufficiently cumbersome, and if its scope of anti-fire regulations were extended it would only apply to new buildings, and could never be made so far retrospective as to be applicable to existing buildings such as crowd the dangerous area above referred to. It is to the great insurance companies that we must look for the remedy. Their own interest will necessitate a revision of their tariffs. Many of the best offices have already minimised their risks in certain crowded City areas, and the time is not far distant when some of those areas will be so far boycotted by the companies that it will be found difficult, if not impossible, to get premises or goods therein insured against fire. The companies, who have already largely raised their tariffs for business premises in latter years, have it in their power, either by refusing to insure or by imposing prohibitive rates in buildings which they deem a source of danger, to compel, throughout the City area, even in old buildings, such mode of construction or alterations as may minimise the spread of a conflagration.

What, then, should they reasonably demand? (1) All parapets of party walls should be raised to a *minimum* of 3 feet above the roofs or flats, instead of the present inadequate 15 inches. (2) All windows and doors opening in front on to streets, or at rear on to common areas less than 30 feet wide, should be fitted with revolving iron or steel shutters, able to be lowered in case of fire. (3) All roofs and flats not built fire-proof should be made fire-resisting by plaster "pugging" between the roof timbers at least 3 inches thick under the slates or lead. (4) All wooden skylights should be replaced by iron. (5) The undersides of all timber floors should be covered with plaster. (6) The wooden entablatures and pilasters to shop fronts, and the wooden dormer-fronts, permitted by the London

THE

PITTMAN PAINT CO., LIM.

2 Colonial Avenue, Minories, LONDON, E.C.

THE PITTMAN PAINT

Has a brilliant polish, thus obviating the necessity of using any varnish, and it will dry in almost every case in less than an hour, and when once dry and thoroughly hardened it will never blister, crack, or peel off.

It is non-poisonous and innocuous, and can be used without fear of paint colic.

The saving in time, labour and material by using this paint is enormous. A Builder, for instance, instead of using three or more coats of ordinary paint, coupled with a coat of varnish, and waiting a considerable time between each for it to dry, and paying labour for each, can with a much smaller quantity of "The Pittman Paint" accomplish all he needs. He can paint a house in the morning and it can be moved into in the afternoon with impunity. Moreover, the paint will not require renewal for a great length of time.

Canvas, Linen, Muslin, Calico, Paper, even Tissue Paper, will become waterproof when the paint is applied; in fact it will **Waterproof anything and everything from a Stone Wall or Iron Girder down to Tissue Paper.**

There is no unpleasant smell attached to it, and it can be scented with any perfume desired by the user.

For the Ironwork of Railway Stations, Girders, Pillars, Machinery, Safes, &c., it will be found invaluable, lasting for years, without the necessity of renewal, and preventing all rust or oxidation.

It is useful for Baths and Tin Work, Stoves and Mantel Pieces, for Metal Advertisement Plates, and in cases where enamel is now used.

It does not sink into the material.

A quick-drying and brilliant paint, too, for Bedsteads, Bicycles and Fancy Metal Articles requiring a fine polish Carriage Builders will find a wonderful saving in using it.

It is non-corrosive and can be applied to ships and shipbuilding purposes.

ANY FURTHER PARTICULARS AND PRICES ON APPLICATION.

Building Act, should be prohibited by the insurance companies in streets less than 30 feet wide. (7) The tariff rate for warehouses having match-lined walls should be made prohibitive.

And, lastly, the insurance rates should be readjusted so as to encourage (a) building with fireproof flats and roofs; (b) building with solid pugged floors; (c) casing with plaster all exposed structural iron-work; (d) heating with hot-water pipes instead of open fireplaces.

No owner or occupier of City property need feel alarmed at the cost of carrying into effect the suggestions here made. It would bear but an insignificant proportion of the entire value of any business premises, and that value would be *pro tanto* augmented by greater stability of construction and lessened annual outlay for fire insurance. But, whatever be the cost, it should be regarded as of small importance compared with that of the risk to which the citizens of London are at present exposed—the risk that their great city and its rich contents may be devoured by fire in a single day or night.

EGYPTIAN IRRIGATION.

IN Sir W. E. Garstin's report on the Irrigation Department for 1896, says the Cairo correspondent of the *Times*, one of the most interesting chapters relates to the Barrage—a name given to the two dams, each of sixty-one arches, which span the Rosetta and Damietta branches of the Nile at the point of their bifurcation, and which, by holding up water during "low Nile," supply summer irrigation to the delta.

It had always been known that the foundations of portions of the structure were more or less defective, and, under the pressure caused by closing the doors in the summer of 1896, certain arches showed signs of hair-cracks, rendering it necessary to ascertain the actual condition of the foundations under the piers. For this purpose vertical holes, about 5 inches in diameter, lined with steel tubing, and passing right through the masonry from the surface of the roadway above down to the subsoil supporting the piers, were bored in certain piers selected for experiment. These borings in fourteen instances revealed the existence of cavities beneath the piers of considerable area, varying in depth from 10 to 92 inches; free water communication was found to exist between certain holes under the dam flooring, in one case between holes 92 feet apart,

and wonder was expressed that, under these conditions, the structure had stood at all.

Specially-prepared clay was forcibly rammed down the borings, but, though useful to some extent, this material could not be forced to travel under water from one cavity to another so as to satisfy the engineers that there was not merely a clay heap deposited at the bottom of each pier-boring, leaving apertures between them. Then liquid cement was poured down the bore-holes instead of clay, and gave evidence of having travelled freely in every direction, but the doubtful point remains if all of it has set. The operation will be continued this autumn and coming winter, and it is intended to make borings in every one of the 124 piers, pouring down liquid cement, which, it is hoped, will render the Barrage far more stable than it is at present.

Sir William Garstin says that, "in spite of the startling disclosures revealed as to the state of the piers, there is no reason for serious alarm regarding the Barrage so long as the up and down stream aprons constructed by Colonel Western remain sound. These have saved the structure hitherto and enabled it to do the work which it has done for the last six years. If the up-stream floor were to give way, it is difficult to see how the construction could stand under the pressure of regulation (meaning when the archways are closed to prevent the river passing). It is, then, indispensable that measures should be taken to strengthen and consolidate the structure itself, and if the work of filling the cavities with cement prove, as it is hoped, successful, this will be done. In any case the work must do good and can do no harm.

"Undoubtedly the best and most efficient way of rendering the Barrage safe would be to permanently reduce the head of water thrown upon it during regulation period. This could best be done by building a supplementary dam further down-stream, which would hold up water, say, to 2 to 2½ metres, and thus reduce the possible difference upon the Barrage itself to something under 2 metres.

"It is probable that a work of the kind in the Rosetta branch would not cost more than 200,000*l.* Levels and sections of the river are now being made and a design will be worked out so that, if funds should ever be available, it could seriously be considered."

The benefits due to the water held up by the Barrage during summer are numerous. The cotton crop has been almost doubled; other cultivation has been greatly increased; large areas of waste lands have been reclaimed; the delivery of

Office of "The Architect," 175 Strand, London, W.C.

water into canals at a high level has greatly reduced the cost of lifting it on to the fields, and, by enormously decreasing the amount of silt deposited, has enabled Government to maintain them by contract work in place of the cruel and wasteful forced labour of former times. The growth of sugar in Upper and Middle Egypt has more than doubled since 1883, and would increase more rapidly were it not for the limitation as regards water supply imposed by necessity. A new French factory at Naga Hamadi is the largest of its kind in the world, and a new English factory at Baliana will commence producing sugar this year (1897).

The crying need of drainage has been met by a grant of 256,000*l.* from the funds in the hands of the Public Debt Commission, to be all expended during 1897 upon works in Lower Egypt; and if they can be induced to grant a like sum for 1898 there is no doubt that the drainage problem in Lower Egypt will be in a fair way to being solved, with enormous benefit to the country and revenue. Nearly sixty miles of agricultural roads were made during the year, and the total length existing throughout the country is 955 miles. The demand for them is steadily increasing, and the fact that 450 miles additional have been voted by the provincial councils of Lower Egypt, to cost nearly 83,000*l.*, which sum will be provided by the landowners themselves, is good evidence of the appreciation of the road system by the people.

Concessions were given for laying and working light railways over two of the delta provinces to Messrs. John Birch & Co., and over three others to the local firm of Messrs. Suares & Co. A light railway between Mansura and Matarieh on Lake Manzaleh has been completed this year (1897).

A new indication of scientific progress in Africa, as already mentioned in the *Times*, is that, since January 1, 1896, the water levels of the Victoria Nyanza have been daily recorded by means of gauges erected at three places, viz. Port Alice, Port Victoria and Lubwas Usoga. The readings, as also a monthly statement, showing the rise and fall of the lake, are received at Cairo; but the records of a series of years are necessary before any attempt can be made certainly to prognosticate the extent of influence that a rise or fall of the lake waters may produce on the Nile. The report states that gauges upon the Albert Nyanza are very urgently required in order to show what are the relations between the levels of that lake and the summer water supply in Egypt. This lake being nearer to the point of delivery, its levels are, if possible, more important to Egypt than are those of Lake Victoria, and the hope is ex-

pressed that the English officials at Uganda may erect gauges and furnish Egypt with records of the daily readings.

Major R. H. Brown, inspector-general of irrigation for Lower Egypt, in his report for 1896 expresses the opinion that as the catchment area of Lake Victoria is comparatively small, the lake may not have such an important influence on the Nile as we are accustomed to attribute, and that gauges at Fashoda, Khartoum and Berber are what is wanted. A Fashoda gauge would give the effect of the rainfall in the "region of the Sudds," where the catchment basin is wide, and of floods in the Sobat River; a Khartoum gauge would show the effect of the White and Blue Niles combined, and a Berber gauge would show the variations of the Nile below its last affluent, the Atbara.

Since the report was written, Berber has been reoccupied by the Egyptians, and a gauge was constructed last June at Merawi, which is useful until one can be set up at Berber.

One of the very few recorded eccentricities of the Nile occurred between November 22 and 28, when the level steadily rose nearly 29 inches at Assuan in place of the average fall of 20 inches during that period. No precautions having been taken against an event so unexpected, the water began to flow into the Upper Egypt basins, which had just been sown, and a quantity of seed was lost.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

THE NEW EXPANDED METAL

Meshes from $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to $\frac{3}{16}$ th in. thickness of steel.

FOR BUILDING CONSTRUCTION, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

FOR SOLID PLASTER PARTITIONS, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

FOR FIREPROOF LATHING, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

FOR CONCRETE FLOORS WITH EXPANDED METAL.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

FOR EXTERIOR WALLS OF BUILDINGS.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

FOR FENCING, TREE GUARDS, WINDOW GUARDS, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

ORNAMENTAL. STRONG. CHEAP.

OTHER USES FOR EXPANDED METAL.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

BRASS, ALUMINIUM, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.
